MINISTRY OF PUBLIC HEALTH

ANNUAL REPORT FOR THE YEAR 1942

Part I.—PUBLIC HEALTH

Chapter I.—VITAL STATISTICS

A.—*Population.*

The estimated population of Egypt in mid 1942 was 17,226,700 as compared with 17,030,100 in mid 1941.

B.—*Births.*

The total number of births for all Egypt during 1942 was 658,324 or a ratio of 38·2 per thousand population as against a ratio of 40·8 in 1941. The highest birth-rate was 64·3 recorded in Suez Governorate. The lowest was 24·5 recorded in Western Desert Governorate.

C.—*Deaths.*

A total of 494,358 deaths were recorded during 1942 in all Egypt or a ratio of 28·7 per thousand population as against 25·9 in 1941. The highest death-rate was 54·1 recorded in Suez Governorate. The lowest was 16·9 recorded in Qena Province.

D.—*Diseases Causing Deaths.*

Table No. 4 shows the principal diseases causing death in localities having health offices, and the death-rate of each disease to total deaths. It is observed from this table that diarrhoea and enteritis are the most prevalent diseases with diseases of the respiratory system following next.

E.—*Age and Sex Distribution of Deaths.*

Table No. 5 gives the number and rate of deaths in the various age and sex groups in all localities having health offices. According to this table, more than one third of these deaths took place within the first three years of age, and almost half the deaths took place before the end of the second year of age.

F.—*Infantile Mortality.*

The number of infantile deaths in all Egypt was 110,847 or 168 per thousand births. In localities having health offices, 53,913 deaths were recorded or 22·1 per cent of births (*vide* table No. 6). It is observed that diarrhoea and enteritis are responsible for most of these deaths. Table No. 6 shows the age distribution of infantile mortality in localities having health offices. According to this table, most of the deaths occur within the first three months of life.

TABLE NO. 1.—SHOWING RATES OF BIRTHS, DEATHS AND INFANTILE MORTALITY
IN EGYPT FROM 1921 TO 1942

Year	Birth-rate per 1000 population		Death-rate per 1000 population		Infantile mortality per 1000 births	
	Egypt	Urban Districts	Egypt	Urban Districts	Egypt	Urban Districts
1921-1925	42·9	49·4	25·3	32·5	144	229

<i>Upper Egypt :—</i>							
Urban (Bandars only)*	917,300	42,457	46·3	38,871	42·4	10,611	250
Urban and Rural ...	6,979,100	248,827	35·7	178,252	25·5	39,035	157
<i>Egypt :—</i>							
Urban (Cities and Bandars)	4,297,300	190,849	44·4	155,741	36·2	43,530	228
TOTAL (all over Egypt)	17,226,700	658,324	38·2	494,358	28·7	110,847	168

* Urban comprises all towns having a Health Bureau provided there is a pure drinking water installation and a municipal or local council.

TABLE NO. 3.—SHOWING THE HIGHEST AND LOWEST BIRTH AND DEATH RATES DURING 1942
IN GOVERNORATES, PROVINCES AND TOWNS HAVING A HEALTH BUREAU

	Govte., Prov. or Town having a Health Bureau	Rate per Thousand
BIRTHS		
Governorate or Province with highest birth-rate	Suez	64·3
„ „ „ „ lowest „ „ „ „	Western Desert ⁽¹⁾ ...	24·5
Town or Bandar (chief town) with highest birth-rate	Kafr el Dawar ...	89·0
„ „ „ „ „ lowest „ „ „ „	Port Fouad	18·2
DEATHS		
Governorate or Province with highest death-rate	Suez	54·1
„ „ „ „ lowest „ „ „ „	Qena	16·9
Town or Bandar (chief town) with highest death-rate	Khanka	83·8
„ „ „ „ „ lowest „ „ „ „	Port Fouad	7·7
INFANTILE MORTALITY		
Governorate or Province with highest infantile mortality	Suez ⁽²⁾	253
„ „ „ „ lowest „ „ „ „	Qena	110
Town or Bandar (chief town) with highest infantile mortality	Maghagha... ..	400
„ „ „ „ „ lowest „ „ „ „	Sidi Salem	68

The birth-rate for all the population of Egypt was 38·2 per thousand.

⁽¹⁾ The birth rate in Red Sea District was 16·3.

⁽²⁾ The death-rate „ „ „ „ 415.

TABLE NO. 4.—SHOWING DISEASES CAUSING DEATHS IN ALL LOCALITIES HAVING A HEALTH BUREAU DURING 1942

Disease	Total Number of Deaths	Death-rate per 1000 of Total Deaths
Notifiable infectious and parasitic diseases exclusive of those marked * hereunder	8,650	43·2
Pulmonary tuberculosis*	3,154	15·7
Other tuberculous diseases	540	2·7
Syphilis	333	1·7
Malaria*	515	2·6
Dysentery	595	3·0
Pneumonia (acute, chronic and non-chronic, including broncho-pneumonia and capillary bronchitis)	7,278†	36·3
Bronchitis	17,002	84·9
Other respiratory system diseases	2,809	14·0
Heart diseases	4,943	24·7
Other diseases of the circulatory system	1,474	7·4
Diseases of urinary and genital system (other than Venereal)	7,927	39·6
Diseases of puerperium and delivery (other than puerperal septicaemia).	709	3·5
Diseases of diarrhoea and enteritis	72,586	362·3
Senility	23,573	117·7
Accidental deaths including suicides	7,510	37·5
Other causes	40,733	203·3
TOTAL DEATHS	200,331	—

† This figure includes 5,663 deaths from acute pneumonia (lobar or bronchial).

TABLE NO. 5.—SHOWING THE AGE AND SEX DISTRIBUTION OF DEATHS IN LOCALITIES HAVING A HEALTH BUREAU DURING 1942

Chapter II.—INFECTIOUS DISEASES

Births.

A total of 658,324 births were recorded throughout the Egyptian Kingdom during 1942 or a ratio of 38·2 per thousand population as compared with 695,016 births and a ratio of 40·8 per thousand population during 1941. During the previous ten years (1931–1940), the birth-rate ranged between 44·5 in 1931 and 41·9 in 1935.

The falling off of births during 1942 is presumed to be the consequence of the war and its attending evils, namely: malnutrition, shortage of food supplies, the migration of the rural population to towns to seek employment with the military forces and the financial depression.

Deaths.

The total number of deaths during 1942 was 494,358 or an increase of 53,377 over 1941. The death-rate was 28·7 per thousand population as against 25·9 in 1941 or an increase of 2·8 per thousand population. The increase in 1942 was mostly in infants, children and old persons.

A.—Monthly Distribution of Deaths.

From a comparison of the monthly distribution of deaths made as far back as 1935 it will be observed that the 1942 death-rate was highest during the months of February to May, reaching its maximum of 39·5 per thousand population in June, after which it subsided and became almost normal during the last four months of the year.

There is no doubt that the extraordinary circumstances of the war and the deficiency in crops and foodstuffs during the first half of 1942 had a direct bearing on the bad state of public health by diminishing the power of resistance and increasing the risk of morbidity particularly amongst infants, children and old people.

B.—Regional Distribution of Deaths.

Cairo City had the greater part of the increase namely 11,321 deaths or one fourth of the total increase in deaths for all Egypt, with Gharbia, Gîza, Menoufiâ, Dakahlia, Aswan and Gerga following in succession.

Deaths from Infectious Diseases.

During 1942, the total number of deaths from the notifiable diseases was 22,949 as compared with 18,469 in 1941 or an excess of 4,480 deaths.

DISTRIBUTION OF DEATHS OF THE MORE IMPORTANT INFECTIOUS DISEASES.

Cholera and Smallpox.

No cases or deaths of cholera or smallpox occurred during the year.

Plague.

3 deaths of bubonic, 3 deaths of septicaemic and 4 deaths of pneumonic plague were recorded in Port Said during different intervals of the year. No other deaths were recorded elsewhere in Egypt. In 1941, 6 deaths were recorded of which 5 were in Port Said and 1 in Abu Tig.

Typhus.

With the exception of Fayoum and Beni Suef, there was an increase in the number of Typhus cases and deaths in all the Governorates and Provinces as compared with the previous year. A total of 4,411 deaths were recorded or a ratio of 25·8 per 100,000 population as against 1,751 deaths and a ratio of 10·4 in 1941. The increase in Typhus deaths occurred mostly in Cairo, and- Alexandria, Lower Egypt Provinces and Gîza.

Malaria.

An increase in malaria incidence and mortality was marked in Aswan, Qena and Girga Provinces as a consequence of the invasion of these regions by the Gambia mosquito.

Incidence of Notifiable Infectious Diseases in 1942.

A total of 102,360 cases with 22,949 deaths of infectious diseases were notified throughout Egypt during 1942 or a case-rate of 594 and a death-rate of 133 per 100,000 population as compared with 77,468 cases with 18,469 deaths notified during 1941, *i.e.* a case-rate of 455 and a death-rate of 109·4 per 100,000 population.

The increase is attributed to the prevalence this year of Typhus, Malaria, Acute Pneumonia, Tuberculosis, Influenza and Typhoid or the diseases which are affected by war time conditions such as malnutrition, congestion and troop movement. There was a noticeable decline in the incidence of plague, smallpox, chickenpox, puerperal fever and whooping cough.

Herebelow is a detailed statement regarding the more important diseases:—

Typhus.

TABLE No. 10.— SHOWS THE TREND OF TYPHUS DURING THE PAST FOUR YEARS

Year	Number of Cases	Ratio per 100,000 Population	Number of Deaths	Ratio per 100,000 of Population	Case-Fatality Rate per cent
1939	4,296	26	788	4·8	18·3
1940	4,416	26	863	5·1	19·5
1941	9,414	56	1,751	10·4	18·6
1942	22,054	128	4,411	25·8	20·0

It is evident from the above table that the case-rate this year is more than twice the rate in 1941 and nearly five times the ratio of 1940 or 1939. The case-fatality-rate is slightly higher than in the previous three years.

Distribution of Typhus Cases according to Governorates and Provinces.

Table No. 17 shows that typhus was prevalent in Cairo and almost all provinces of Lower Egypt and Gîza. This was attributed to congestion caused by the arrival of refugees from coastal towns and labour seeking employment with allied troops. Beni Suef Province had less cases than in 1941.

Four-Weekly Distribution of Cases and Comparison with Previous Years.

Perusal of Table No. 19 shows that 1,236 cases were recorded during the first four weeks of the year. A gradual rise in the incidence was maintained until the 17th-20th weeks ended May 20, 1942, when the highest level of 4,623 cases was reached. A decline then followed reaching its lowest level of 142 cases during the 37th to 40th weeks ended October 6, 1942, after which the rise was resumed until 922 cases were recorded during the last four weeks of the year.

Typhus Cases and Deaths and Rate per Million Population and Case Fatality Rate per Thousand from 1905-1942 (Vide Table No. 18).

Typhus was less prevalent during the present war as compared with World War I. Whereas 22,054 cases or 1,289 per million population were recorded during 1942; 9,414 cases or 558 per million in 1941; and 4,416 cases or 263 per million in 1940; 30,507 cases or 2,412 per million population were recorded in 1916; 17,096 cases or 1,368 per million in 1915 and 9,508 cases or 771 per million in 1915.

The case-fatality-rates during this war were 19·5 per cent in 1940, 18·6 per cent in 1941 and 20 per cent in 1942 as compared with 26·6 per cent in 1914, 24·7 per cent in 1915 and 23·3 per cent in 1916.

TABLE NO. 11.—BLOOD SPECIMENS FOR WEIL FELIX REACTION TAKEN FROM TYPHUS PATIENTS AND SUSPECTED DEATHS AND RATIO OF POSITIVE RESULTS.

Year	Number of Specimens	Positive for Weil Felix	Negative for Weil Felix	Unfit for Exam.	Percentage of Positives
1942	From Patients: 36,610	12,897	21,999	1,714	35
	From Deaths: 8,429	1,755	4,845	1,829	21·6
1941	From Patients: 19,252	3,688	14,784	780	19·2
	From Deaths: 3,002	220	2,016	766	7·3

Plague (Table No. 22).

A total of 15 cases of plague with 10 deaths were notified throughout Egypt during the year. The following table shows the trend of the disease during the past four years :—

TABLE NO. 12

Year	BUBONIC			SEPTICAEMIC			PNEUMONIC			TOTAL				
	C.	D.	C.F.R.	C.	D.	C.F.R.	C.	D.	C.F.R.	C.	Rate	D.	Rate	C.F.R.
			%			%			%		%		%	%
1939	160	50	31·2	9	9	100	—	—	—	169	1	59	0·3	34·9
1940	395	142	35·9	92	92	100	4	4	100	491	2·9	238	1·4	48·4
1941	14	6	42·9	—	—	—	—	—	—	14	0·08	6	·03	42·9
1942	7	3	42·9	3	3	100	4	4	100	15	0·09	10	·06	66·6

Regional Distribution of Cases.

14 cases occurred in Port Said : 1 in January, 1 in June, 3 in July, 2 in August and 7 in November. One case occurred in Ismailia in December.

Vaccination against Plague.

As no cases of plague were reported from other parts of Egypt than the Canal Zone, vaccination was limited to that region. A total of 51,393 persons were vaccinated in Port Said and 170 in Ismailia none of whom developed the disease.

The number of cultures and blood films taken from the various Governorates and Provinces is given hereunder :—

TABLE No. 13

Year	Number of Cultures	From alive		From dead		Number of Films	From alive		From dead	
		Pos.	Neg.	Pos.	Neg.		Pos.	Neg.	Pos.	Neg.
1941... ..	1,384	8	28	4	1,344	1,133	9	26	2	1,096
1942... ..	1,084	10	117	6	951	667	12	7	6	642

Deratisation.

The stationary posts set up during 1941 at mouths of Ismailia Canal in Shubra, Tewfiki, Menoufi, and Beheri Rayahs in Delta Barrage and Ibrahimieh, Yusfi and Walidieh Canals near Assiut Dam continued to exterminate rats from river craft. During 1942, more posts were set up in Deirout town, Sahil Athar el Nabi, Old Cairo, Canal locks at Ismailia and Mahmoudieh. 68,184 boats were supplied with traps which caught 44,114 rats. In addition, some 21,310 live and 97 dead rats were caught by rat gangs in towns and villages. Of this number, 11,858 live and 77 dead rats were caught in Port Said.

The installation of these river posts and the almost total suspension of river transport of goods from the Ports as a consequence of the war have been responsible for the disappearance of plague from the interior of the country.

Typhoid and Paratyphoid (Table No. 17).

During the year, a total of 6,814 cases were reported from all Egypt or a ratio of 39 per 100,000 population with 1,257 deaths or 7 per 100,000 population. The case fatality rate was 18·4 per cent as against 5,758 cases and 1,179 deaths in 1941 or a ratio of 34·1 and 7 per 100,000 population and a case fatality rate of 20·5 per cent. As compared with 1941, there was a rise in the incidence of typhoid in Cairo, Alexandria, Port Said and Suez and a decline in most of the provinces.

Anti-Typhoid Vaccination.

A total of 362,201 persons were vaccinated against the enteric fevers. Of this number 47,739 were vaccinated by private practitioners and 314,462 by health units. These included 43,290 persons vaccinated by the Prisons Department, 21,616 by Army Medical Service, 84,158 in Alexandria and 112,724 in Cairo (*vide Table No. 24*).

Smallpox.

With the exception of two cases in 1940, no cases or deaths of smallpox were reported during this year or the past three years.

Smallpox General Vaccination (Table No. 23).

Although no cases of smallpox were discovered, the periodical general vaccination of the population was continued. A total of 4,081,256 persons were vaccinated during the year in Dakahlia, Menoufia, Behera, Minia, Girga and Gîza Provinces, the Canal Governorate, and some Frontier Districts.

Cerebro-Spinal Meningitis (Table No. 17).

212 cases with 101 deaths were reported during the year or a case-rate of 1·2 and a death-rate of 0·6 per 100,000 population and a case-fatality-rate of 47·6 per cent as against 159 cases and 94 deaths in 1941 or a case-rate of 0·9 and a death-rate of 0·5 per 100,000 population and a case-fatality-rate of 59·1 per cent. Most of the cases were recorded in Cairo, Alexandria, Port Said, Suez and Gharbia Province.

Diphtheria (Table No. 17).

3,950 cases of Diphtheria with 1,882 deaths were reported during the year or a case-rate of 22·9 and a death-rate of 10·9 per 100,000 population and a case-fatality-rate of 47·6 per cent as against 4,037 cases with 1,932 deaths in 1941 or a case-rate of 23·9 and a death-rate of 11·4 per 100,000 population and a case-fatality-rate of 47·8 per cent.

There was a relative excess of cases this year in Behera, Dakahlia, Menoufia, Kaliubia, Assiut and Beni Suef, but these were less in Cairo and Alexandria.

Anti Diphtheria Immunization.

89,214 children between one and 10 years of age received anatoxin injections. Of these 187 children (107 in Alexandria and 71 in Cairo) developed diphtheria after receiving the three injections (*Vide* table No. 25).

Measles (Table No. 17).

A total of 9,764 cases of measles with 3,654 deaths were recorded during the year or a case-rate of 56·6 and a death-rate of 29·2 per 100,000 population and a case-fatality-rate of 37·4 per cent as against 9,769 cases with 2,870 deaths during 1941 or a case-rate of 57·9 and a death-rate of 17 per 100,000 population and a case-fatality-rate of 29·3 per cent.

There was an excess of cases in Cairo, Dakahlia, Menoufia, Kaliubia, Assiut, Beni Suef, Giza and Qena, but there were less cases in Alexandria, Suez, Behera, Gharbia, Aswan and Fayoum.

Influenza (Table No. 17).

12,965 cases with 218 deaths of influenza were recorded during the year or a case-rate of 75·3 and a death-rate of 1·3 per 100,000 population and a case-fatality-rate of 1·7 per cent as against 11,120 cases with 178 deaths in 1941 or a case-rate of 65·9 and a death-rate of 1 per 100,000 population and a case-fatality-rate of 1·6 per cent.

Pneumonia (Table No. 17).

6,215 cases with 5,296 deaths of pneumonia were recorded during the year or a case-rate of 36·1 and a death-rate of 30·7 per 100,000 population and a case-fatality-rate of 85·2 per cent as against 5,414 cases with 4,843 deaths during 1941 or a case-rate of 32·1 and a death-rate of 28·7 per 100,000 population and a case-fatality-rate of 89·4 per cent.

Control of Pilgrims.

11,687 Egyptian pilgrims proceeded to the Hedjaz this year of whom 11,685 returned 2 having died in the Hedjaz and Tour. 12 of the returning pilgrims were admitted to infectious diseases hospitals during the observation period. These were diagnosed as follows: 1 chicken pox, 1 smallpox, 1 paratyphoid in Abbassia Fever Hospital, 1 influenza in Shebin el Kom and the remainder were not found suffering from any infectious diseases.

During the segregation of pilgrims in Tour Quarantine on their return from the Hedjaz, 4 suspected smallpox cases were detected amongst the pilgrims in January. It was later discovered that the Hedjaz was overrun by a smallpox epidemic which has been transmitted to this country by the pilgrims.

Infectious Diseases Hospitals (Table No. 26).

Up till the end of 1942, there were 19 isolation hospitals in Governorates and Bandar towns, 15 built up village shelters and 28 cordons consisting of tents.

A total of 52,490 patients (31,849 males and 20,641 females) were admitted to the infectious diseases hospitals. Of these 43,745 (26,414 males and 17,331 females) recovered; 2,523 (1,870 males and 653 females) improved and 5,222 (3,238 males and 1,984 females) died.

These figures do not include patients isolated in village shelters or cordons.

TABLE NO. 14.—BIRTH-RATE, DEATH-RATE AND INFANTILE

Localities	1937			1938		
	Birth-rate per 1000 Population	Death-rate per 1000 Population	I.M.-rate per 1000 Births	Birth-rate per 1000 Population	Death-rate per 100 Population	I.M.-rate per 1000 Births

Chapter III.—INDUSTRIAL HYGIENE

An Industrial Hygiene Section has been created by Ministerial Arrêté dated July 21, 1942, and charged with the Control of Unhealthy Establishments and Labour hygiene.

UNHEALTHY, INCONVENIENT AND DANGEROUS ESTABLISHMENTS

A.—*Applications for New Permits.*

212 applications for permits for new unhealthy establishments of the First Class were received during the year as compared with 136 in 1941 ; and 9 applications for permits for new general and cattle markets as compared with 12 in 1941. The above figures do not include applications for permits in the provinces of Dakahlia, Gharbia, Behera and Menufia and Damietta Governorate, as these are still being dealt with by the Committee convened in the Labour Department to facilitate procedure of issuing these permits.

B.—*Licensed Establishments actually Working.*

During 1942, the total number of the three classes of unhealthy establishments licensed in all provinces and governorates (Alexandria excluded) was 66,922 as against 74,572 in 1941.

C.—*Ministrial Arrêtés.*

Conforming with the ruling given by the Contentieux, 14 Ministrial Arrêtés were issued during the year imposing new conditions for the improvement of the sanitary conditions of licensed establishments.

D.—*Amendment of Designation in Schedule of Unhealthy Establishments.*

By Ministrial Arrêté dated March 17, 1942, the title " Timber depots for commercial purposes or owned by building contractors " in Class II Category A. of the Schedule has been amended to read : " Timber Depots for commercial purposes or owned by building contractors and upholstery depots containing over 100 beams, 100 poles and 25 wooden benches. "

Chapter IV.—FOOD CONTROL

Introduction.

The number of samples taken from the various foodstuffs, including milk and its products, all over the country (except Cairo and Alexandria Governorates which issue special reports) amounted to 60,969 as against 67,207 samples taken in 1941.

The decrease in the number of samples taken this year is attributed to the scarcity of foodstuffs on sale, especially those imported from abroad, owing to present war time conditions.

Condemnation of Foodstuffs Unfit for Human Consumption.

The following table gives the quantities of foodstuffs and drinks condemned during this year and the previous two years:—

TABLE No. 27

	1942	1941	1940
Okes	196,860	155,734	136,923
No. of Units... ..	106,790	184,014	27,754
Bottles	12,658	7,947	5,906
Tins	25,031	24,766	62,860

The increase in foodstuffs and drinks condemned in okes, bottles and tins is due to the fact that great quantities of fruits, vegetables and prepared foods, flour, bread, aerated water and non-alcoholic drinks were not destroyed by dealers on becoming unfit for consumption because of the general rise in prices.

Proportion of Deteriorated and Adulterated Samples taken for Analysis.

Great attention is paid to the control of foodstuffs which are much adulterated, such as oils, butter, masli and flour. Of the total samples taken this year for analysis, 2·9 per cent were adulterated and 3 per cent deteriorated as against 3·9 and 3·2 per cent respectively last year. The highest ratio of adulteration in oils was in lettuce oil (16·1 %), linseed oil (6·5 %) and olive oil (4·4 %).

3·6 % of the samples of flour were adulterated as against 7·2 per cent last year. This is due to the application of martial law this year which provided severe penalties for the adulteration of flour. The ratio of adulteration in curdled milk was 15·7 per cent and in cheese 6·3 per cent.

The highest ratio of deterioration was in fish namely 42·8 per cent, followed by aerated water which was 17 per cent. In sunflower oil, this was 15·6 per cent, and in canned vegetables and fruits it was 11·7 per cent.

Control of Milk.

Special attention is paid to the control of milk. The number of milk samples taken this year was 24,825 as against 25,055 last year and 26,095 in 1940. 7·5 per cent of the samples taken were found adulterated as against 6·6 per cent last year.

Application of Itinerant Vendors and Milk Regulations and Law No. 48, 1941.

The provisions of the itinerant vendors and milk regulations are strictly applied in towns where these are in force. The provisions of Law No. 48, 1941, dealing with fraud and adulteration are also vigorously enforced.

The following contraventions were drawn up:—

10,779 contraventions against itinerant vendors for violating the regulations.

2,829 contraventions for offences against Law No. 48 of 1941.

5,452 contraventions against milk vendors for violating the regulations (*see* Table No. 31).

The following licences were issued to itinerant and milk vendors:—

Number of licences issued to itinerant vendors 843

Number of licences issued to milk vendors 371

Control of Foodstuffs Imported from Abroad.

Tables No. 33 and 34 give details of the work done in connection with the control of foodstuffs imported from abroad.

According to table No. 33, 11,029 consignments were examined during this year as against 13,724 last year. Of 690 samples taken from these consignments, 249 samples were deteriorated and 8 adulterated, or 36 per cent of the former and 1·15 per cent of the latter.

Despite the decreased number of consignments imported this year as a result of present importation difficulties, the quantities of foodstuffs destroyed or refused entry into the country on account of unfitness for human consumption were in all more than three times those of last year. A total of 819,580 kgs. of foodstuffs were destroyed or refused entry during the year as against 267,318 kgs. last year and 245,710 kgs. in 1940. This is mainly due to shipping difficulties causing the late arrival of consignments at their destination, the importation of foodstuffs of inferior quality or badly prepared owing to present high prices of materials.

Table No. 34 demonstrates the efforts exercised in the control of imported foodstuffs with a view to preventing the entry into the country of deteriorated foodstuffs.

Outbreaks of Food Poisoning.

13 major outbreaks of food poisoning were recorded during the year. (*Vide* Table No. 35).

Considering that most of these outbreaks were caused by eating cheese which was proved by analysis to contain streptococcus microbes, experiments were carried out to determine the effect of salt in cheese on the life of these microbes.

The following are the findings:—

TABLE No. 28

No. of Sample	Percentage of salting	Temperature	Results after						
			1 month	1½ Months	2 Months	3 Months	4 Months	5 Months	6 Months
	%								
1	8	Temperature of the room	—	—	—	—	—	—	—
2	10	— do —	—	—	—	—	—	—	—
3	12	— do —	+	—	—	—	—	—	—
4	15	— do —	+	+	—	—	—	—	—
5	8	Refrigerator	+	+	—	—	—	—	—
6	10	— do —	+	+	+	+	+	—	—
7	12	— do —	+	+	+	+	+	+	—
8	15	— do —	+	+	+	+	+	+	—

This indicates that :—

(1) The streptococcus microbes in cheese die sooner when stored under the normal temperature of the room than when stored in a refrigerator.

(2) Increasing the salt content in cheese from 8 per cent to 15 per cent tends to lengthen the life of the streptococcus microbes whether the cheese is stored under the normal temperature of the room or in a refrigerator.

Legislation.

1.—Itinerant Vendors Project-Law.

This project-law is still in the House of Deputies.

2.—Milk Project-Law.

The milk project-law has been revised by the Ministry and put in decree form and is in the course of publication.

3.—Project Decree Governing Manufacture and Trade in Flour and Bread.

The Permanent Consultative Food Board has completed revision of this project decree. Several provisions dealing with starch, yeast and baking powder have been added.

4.—Decree concerning Colouring Matters Permissible in Foodstuffs.

As directed by the Contentieux, the project regulations governing colouring matters permissible in foodstuffs has been revised and put into decree form to be issued under provisions of articles 5 and 6 of law 48, 1941, prohibiting fraud and adulteration.

5.—Project Decree governing Meat and its Products.

A project-law governing meat and its products and importation thereof has been prepared and submitted to the Permanent Consultative Food Board for consideration.

6.—Project-Law governing Food Receptacles.

A project decree governing receptacles used in the preparation, storage, sale or handling of foodstuffs has been drawn up and submitted to the Permanent Consultative Food Board for consideration.

TABLE No. 29.—SHOWING QUANTITIES OF FOODSTUFFS CONDEMNED, NUMBER OF SAMPLES TAKEN AND RESULTS OF THEIR ANALYSIS DURING 1942.
(THIS LIST DOES NOT INCLUDE THE FIGURES FOR CAIRO AND ALEXANDRIA GOVERNORATES AND THE FOOD CONTROL GANGS AT THE PORTS).

Chapter V. HEALTH INSPECTORATES

The Inspectorates Section has pursued its activities in raising the standard of public health in the country. All of the three Divisional Health Inspectors have continued to carry out regular inspections of the various units throughout Upper and Lower Egypt with a view to advising and instructing the officials and employees in the best methods of carrying their official duties in an efficient manner.

At the same time, all complaints received by the Ministry were passed to the respective Inspectors for investigation and report. As a consequence, the work is now running more smoothly.

Medico-Legal Work

During the year, 36,682 accidental cases and 85,682 criminal cases were examined by the medical officers of the Ministry throughout the country as against 33,455 accidental and 82,442 criminal cases in the previous year.

Chapter VI.—HEALTH PROPAGANDA

Motor cars, the only means of carrying on rural propaganda among villagers, were fewer in number, as a result of prevailing war time conditions.

Nevertheless, the Ministry succeeded in introducing new items and new procedures, and in extending health education to certain classes of the community who were formerly beyond reach.

The following is a summary of the propaganda activities :—

(1) Each Propaganda Unit in the Country is to give simple lectures to nine Compulsory Schools at a time, for a period of three months ; then it moves to another nine schools for the same period, and so on.

(2) Propaganda against infectious diseases is most successful when carried out shortly before epidemic seasons. Accordingly, the Ministry planned several campaigns against Typhus, Typhoid, Purulent Ophthalmia and Diphtheria, each of a week's duration. -

Lice and flies, as vectors of disease, were allotted a special widespread campaign ; the different ways and means through which these dangerous insects spread many a disease, were explained in a practical way. The public was shown how to get rid of lice and flies.

(3) Motor cars equipped with gramophones and loudspeakers visited the different quarters of Cairo and the principal cities. Day-time lectures were delivered in colloquial Arabic to an ever increasing audience.

(4) Posters, attractive and instructive, on various subjects of importance were designed and will soon be distributed.

(5) At the request of the Alexandria Municipality Health Division, a campaign against Typhus and Typhoid was waged, resulting in a reduction of infections to a minimum, and a better understanding on the part of the inhabitants of the preventive measures.

(6) Public Meetings, with the aid of Cinema films, were held for the benefit of the workers of the Ramleh Tram, Alexandria. Monotony was dissipated by the demonstration of interesting films dealing with other than health matters.

(7) Films touching on light items of general culture, were added to the program of meetings in public parks in which only health films were demonstrated last year.

(8) The principles of hygiene and practical preventive measures have continued to be incorporated in tales and plays which proved popular among villagers and pupils of compulsory schools.

Last year's program was continued, the following in particular :—

(1) Public parks meetings, in Cairo and suburbs, were regularly held during summer.

(2) Cinema health shows were presented to workers and labourers of certain corporations.

(3) Theatrical representations dealing with health problems have met with unprecedented success. The plays are most appealing to the public and the health instructions and advice contained therein are well absorbed and not easily forgotten.

(4) Lectures to the Police and Army forces were continued.

(5) Instructive health meetings, aided by cinema films, for the benefit of pupils and students of primary and secondary schools were provided.

(6) Broadcasts were continued, with special attention to psychological subjects personal hygiene and physical culture, proportionate to their effect on Public Health.

Health education was also extended to Cairo orphans resident in both government and private institutions. Special performances dealing with elementary principles of hygiene were presented at these institutions as well as to Cairo Scouts and Fouad Sanatorium, Helwan.

Propaganda units participated in the prophylactic sanitary measures taken to safeguard refugees arriving from areas vulnerable to air raids. Medical Officers of these units also cooperated in anti-epidemic campaigns, typhus and malaria in particular. A decrease in the medical work of these units was observed in consequence but this was compensated by gains in training and experience in propaganda work.

Herebelow are some observations made during the year:—

(1) Pupils of Compulsory and Primary Schools prefer health education given in the form of tales particularly if these touch on current affairs in their environment. If delivered in the form of classical lectures, these are apt to produce monotony.

(2) Meetings held in villages are best attended when accompanied by the playing of gramophone records or singing transmitted by loudspeakers in propaganda vehicles.

(3) Students of secondary and intermediate schools prefer ordinary classical lecture which best suit their standard of education, provided the lectures do not last more than half an hour.

(4) The public with their fair standard of education, prefer plays and sketches which stir the interest by their comic features irrespective of their duration.

(5) The well educated classes, however, *e.g.* university students, members of clubs, societies, etc., prefer classical lectures which should contain new data.

TABLE No. 36. —GIVING DETAILS OF PROPAGANDA WORK DURING THE YEAR

On June 16, as the result of the occurrence of a first case of Plague, Port Said was considered as infected with plague. The last case occurred on November 22. Three cases of bubonic plague were also reported from Kantara (port on the Suez Canal) during the year, the first occurred on July 7th and the last on August 13th. A first case of Plague was also reported at Ismailia (port on the Suez Canal) on December 24, 1912.

1.—INSPECTION OF VESSELS, PASSENGERS, DISEASES LANDED FROM VESSELS

As provided for in Article 48 of the Quarantine Regulations, all vessels arriving at Egyptian Ports must — before communicating with the shore — be medically inspected.

Special attention was paid to arrivals from places against which quarantine restrictions are in force.

During the year, a certain number of localities were added to the list of places of this category, viz. :

June 9 a decision was taken to apply quarantine restrictions to arrivals from Kenya by air routes on account of Yellow fever ;

Oct. 10 quarantine restrictions against smallpox were enforced on arrivals from Syria and Lebanon ;

Nov. 15 quarantine restrictions against plague were enforced on arrivals by all routes from Haifa.

26 quarantine restrictions against Yellow fever on arrivals from the Anglo-Egyptian Sudan, whole territory, were cancelled and restricted to the territory lying south of 15° northern latitude.

Vessels coming from any of the infected localities are subjected to detailed medical inspection ; this is followed up by surveillance of passengers at their place of destination in Egypt for periods varying according to the incubation period of the disease.

The following table No. 39 gives the details of the vessels dealt with in 1942 :—

TABLE NO. 39.—SIMPLE MEDICAL INSPECTION

Port of	Postal	Cargo	Tanker	Warship	Sailing vessels	Various	Total

(*) The number included 280 vessels submitted to detailed medical inspection. (†) Including 3 pilgrim ships.
(‡) Including 8 pilgrim ships.

N.B.—The work at Mersa Matrouh, Sollum and Sidi Barrani was suspended.

Ships transiting the Suez Canal may, under certain conditions specified in the Quarantine Regulations, be exempted from the quarantine inspection after they have already been visited at Port-Said or Suez.

The vessels thus exempted were :—

Suez : 29 vessels coming from Port-Said.

Port-Said : 97 vessels coming from Suez.

The following table No. 40 shows the cases of diseases landed from vessels for treatment :—

2.—CONTROL OF AERIAL NAVIGATION

As the result of the extension of the war to the Mediterranean, the terminal aerodromes and airports of the International air traffic were transferred from Alexandria to Cairo (Rod el Farag and Almaza Aerodromes); Port-Said and Luxor Aerodromes were also used as landing places.

At Luxor, the aeroplanes alight for the purpose of refuelling: in the case of those arriving from the South, special precautions were taken to avoid any contact.

All aircraft coming from the South were disinsectised by means of "Pyroicide 20."

The following table gives details of the aircraft dealt with during the year :—

TABLE No. 42

CAIRO :

Rod el Farag (seaplanes)	315
Almaza Aerodrome (airplanes)	1,550

Including :—

Egyptians	622
British	394
American	232
South African	247
Belgian	50
Other Nationalities	5

The passengers landed and embarked were as follows :—

											Landing	Embarking
CAIRO :												
Almaza Aerodrome: Total											10,442	10,387
Including :—												
Civilians											2,968	3,510
Military											6,602	6,566
Diplomats											184	137
Company Staff											550	133
Other Categories											138	41
Rod el Farag: Total											5,209	
Including :—												
Civilians											1,206	
Military											3,709	
Company Staff											294	

During the year, 489 aircraft were disinsectised at Almaza and 85 insects found ; at Rod el Farag, 121 seaplanes were disinsectised and 27 insects found.

Apart from the disinsectisation of aircraft, a permanent control of mosquito breeding places is carried out in a radius of three kilometres around the aerodromes at Alexandria (aerodrome and seaplane base), Rod el Farag, Almaza, Luxor (aerodrome and seaplane base). The larvæ and adult mosquitoes found are forwarded to Fouad I Research Institute for identification.

3.—CONTROL OF PILGRIMAGE

A.—Outward Movement.

The pilgrim season of year 1360 of the Hegira (1941-1942 A.D.) was opened with the arrival of Palestinian pilgrims in Egypt via Kantara on November 17, 1941.

On that date the usual measures were enforced for the control of the pilgrims arriving in Egypt and vessels transiting the Canal en route for the Hedjaz.

These measures remained in force until the departure of the last pilgrim ship from Suez, on December 23, 1941.

The measures include the vaccination of all foreign pilgrims proceeding to the Hedjaz against cholera and smallpox. All pilgrims were found vaccinated except one Palestinian who received the second dose of anticholera vaccine at Kantara.

In 1942, all foreigners who transited Egypt en route for the Hedjaz numbered 943 including Palestinians 841, Transjordanians 53, Syrians 46, Lebanese 3. This number exceeds the number arrived last year by 391.

The transport of Egyptian pilgrims was assured by the Misr Shipping Company which allocated three vessels, viz. the S.S. Taif, Talodi and Rizwani for this transport. These three ships transported all the pilgrims from Suez in six trips between December 2 and December 23. The number of pilgrims who embarked at Suez were :—

Egyptians	3,302
Palestinians	859
Transjordanians	46
Hedjazians	23
Syrians	40
Other Nationalities	11
TOTAL	4,281

Part III.—SOCIAL HYGIENE

Chapter VIII.—MATERNITY AND CHILD WELFARE

In the year 1942, Law No. 46 was issued. It aims at improving rural hygiene. Art. 10 provides a Maternity and Child Welfare Centre for every group of population amounting to 15,000. A similar scheme is followed in urban areas. Nineteen Provincial Maternity and Child Welfare Centres were consequently annexed to this Ministry as from May 1, 1942, together with their Midwifery Schools.

In order to raise the technical standard of midwives and health visitors working in welfare centres, a Ministerial Arrêté was issued on November 12, 1942, organizing the curriculum of these schools, the graduates of which will be called "Asst. midwives and health visitors."

Midwives in Practice are required to attend child and maternity welfare centres every four years for a refreshing course. Their permits are renewed for only four years pending their passing a refreshing examination.

Two mobile child welfare centres were opened at Dessouk and Beni Mazar.

A new centre was established at Cairo (Zeitoun District) to serve this remote suburb.

A two-bed room was provided in each Maternity and Child Welfare Centre for cases of difficult or spontaneous labour. Crèches are provided within the proximity of certain child welfare centres and are kept under constant supervision.

Table No. 51 gives statistics of the activities of Maternity and Child Welfare Centres during the year 1942 as compared with those of 1941.

Chapter IX.—CHEST DISEASES

TUBERCULOSIS STATISTICS IN EGYPT

According to previous reports, the total number of tuberculous cases recorded by the chest diseases dispensaries up till 1941 was 35,891. During 1942, a further 5,986 were detected, bringing the total number of cases since 1929 when the campaign against tuberculosis was first launched until the end of the current year, to 41,877.

Hereunder are details of the cases discovered during 1942 at each dispensary, tabulated according to their occupation and geographical distribution.

The following table shows the professions of these patients before contracting the disease:—

MERCHANTS 285 (*i.e.* 4·7 %) comprising: 64 food vendors.
16 poultry and cattle merchants.
60 grocers.
36 fruiterers.
109 other trades.

EMPLOYEES 425 (*i.e.* 7·1 %) of whom: 227 Government employees.
93 commercial employees.
30 school teachers.
75 other occupations.

WORKMEN 1,710 (*i.e.* 28·5 %) including:

59 cooks, 60 waiters, 90 barmen, 72 servants, 21 office attendants, 40 gate-keepers, 63 hairdressers, 47 laundry men, 76 drivers, 115 tailors, 104 shoemakers, 117 carpenters, 30 painters, 46 building labourers, 81 company employees, 105 weavers, 114 mechanics, 44 printers, and 426 other workmen.

FARMERS 1,183 (*i.e.* 19·7 %).

STUDENTS 145 (*i.e.* 2·4 %).

UNEMPLOYED 2,238 (*i.e.* 37·4 %) comprising: 1,346 idle at home.
356 children.
536 unemployed.

ANTI-TUBERCULOSIS MEASURES

A.—*Social and Preventive Measures*

These consist of:—

(1) Examination of contacts to detect and treat early infections. Contacts are advised by doctors and health visitors, both at the dispensaries and in their homes, in how to evade infection by leading a healthy life.

During this year, no less than 7,400 contacts including 3,234 children were examined, amongst whom 322 developed tuberculosis.

(2) Patients who by nature of their work come in contact with the public are dissuaded from pursuing their occupation, and in return, they are provided with food, material for clothes and rent by the dispensaries.

Two Legislations will shortly be published concerning itinerant food vendors and domestic servants including maids, nurses, wet nurses, etc. These provide that members of the two categories will not be authorised to pursue their occupations before they are pronounced free from infectious diseases and tuberculosis.

(3) Grants and Contributions: Provincial Council contributions to local dispensaries which varied from L.E. 100-270 per annum proved insufficient for helping the patients. An appeal to raise these contributions to L.E. 350 was generously answered by some of the Councils who could afford it. On the other hand, the sum of L.E. 1,800 granted by the Government for this purpose was exhausted before the end of the financial year 1941-1942 and a further L.E. 500 were granted to meet the needs of patients until the end of the year. All this, however, proved inadequate in the face of the ever increasing number of patients and their various needs. The Ministry consequently asked that the Government grant be raised to L.E. 10,000 and finally it was possible to obtain L.E. 5,000 which, it is hoped, will allow a more liberal help to be offered to poor patients and their dependents. During the year 1942, about 1,000 families benefited by this scheme to the extent of L.E. 4,946.646. The dispensaries were further able to obtain from charitable societies and individuals various sums which have all been distributed among the most deserving cases.

(4) Whenever possible, patients who are under treatment and sufficiently recover-ment their health are offered suitable jobs in the Chest Diseases Units so that they may remain under constant medical supervision.

(5) Special care is taken of the health of students on whom depends the future of the Nation. Whenever they fall victims to the disease, they are given priority for admission to the Sanatoria.

B.—Treatment

(1) Dispensaries.

A new chest diseases dispensary was opened in Qena on April 11, 1942, thus bringing the total number of dispensaries in Egypt to fifteen. Three branch clinics were opened in Menouf (23-8-41), Samallout (14-10-42) and Luxor (6-12-42) in connection with Shebin el Kom, Minia and Qena dispensaries respectively. These branch clinics proved such a success that it is proposed to open more branches to the other dispensaries.

Out of 97,367 new patients consulting the dispensaries during the year, 5,986 were found tuberculous. Of the latter, 284 were children (4.7 %) and 5,702 (95.3 %) were adults. The health visitors paid 24,286 visits and the medical officers 5,131 visits to patients in their homes this year.

Hereunder is the summary of the various treatments given by the dispensaries during the current year and their results:—

TABLE NO. 52.—SHOWS THE RESULTS OF DOMICILIARY TREATMENT OF PATIENTS

		Total Number of patients during 1942

	{ „ do full work	251

(2) Sanatoria and Dispensary In-Patient Departments.

In further pursuance of its policy to relieve congestion in Sanatoria, the Ministry provided two in-patient departments in the dispensaries at Tanta (4-7-42) and Assiut (26-12-42) thus bringing the number to six with an accommodation of 135 beds, besides 882 beds at Helwan and Abbassia Hospitals.

It has been observed that some of the patients forwarded by the dispensaries to the sanatoria for surgical operations cannot afford the travelling expenses. Financial authority has now been obtained to meet such expenditures from Government funds.

Blood transfusion may be deemed essential when major operations are undertaken. Suitable donors, who are selected from the healthy employees of the sanatoria are now granted the sum of one pound for each donation in recognition of their service:

The following table No. 53 gives details of patients admitted to Helwan and Abbassia Sanatoria and to In-patient Departments at Mansoura, Zagazig, Damietta, Fayoum and Tanta Dispensaries.

(3) *Preventoria.*

There are now four preventoria of which two are in Cairo, the third at Assiut and the fourth was at Alexandria but, owing to air raids, it was transferred to Mehalla el Kobra and started working on August 22, 1942. The number of children admitted to these Institutions during the year was 103 of whom:—

36 were contacts of their fathers.

47 „ „ mothers.

4 „ „ brothers or sisters.

5 „ of other relatives.

These children are under continuous medical care and also receive appropriate education.

(4) *Bone Tuberculosis Sanatoria.*

There are now two of these in operation, a sea-side one at Alexandria and another, inaugurated on January 8, 1942, at Abbassia Chest Diseases Hospital with an accommodation of 50 beds.

During this year, 326 patients were admitted and 279 discharged. 215 received ultra-violet radiation and major operations have been performed on 46. Plaster encasement was applied to 174 of whom 61 were discharged. 482 skiagrams were taken.

Chapter X.—LEPROSY

The anti leprosy campaign was started in 1929 by the creation of a treatment centre in Cairo. This was followed by other units created in the chief towns of provinces until, by the end of 1942, there were 10 main units with 36 branches. Most of the capitals of provinces are provided with clinics for the detection and treatment of lepers. The units do not only serve the capital of the province but also the neighbouring villages. The patients are thus spared the trouble and expense of having to attend the main clinic for treatment.

Leprosy Units and Branches.

(1) Abu-Zaabal leprosy colony. This is actually used for the isolation of male lepers. The necessary buildings for isolating female lepers as well are in the course of construction.

(2) Cairo leprosy hospital is temporarily accommodating female patients until the necessary buildings at Abu-Zaabal colony are completed. This hospital has three out-patient branches attached to it at Kalioub, Imbaba and Kara-Midan.

(3) Zagazig leprosy clinic and its 5 branches at Abu Hammad, Shebin el Kanater Mashtoul, Minia el Kamh and Abu Kebir.

(4) Tanta leprosy clinic and its 4 branches at Zifta, Mahalla el Kobra, Kafr el Zayyat and Kellin.

(5) Shebin el Kom leprosy clinic and its 5 branches at Menouf, Ashmoun, Quesna, Benha and El Batanon.

(6) Mansoura leprosy clinic and its 4 branches at Damietta, Simbellawen, Sherbin and Dekernis.

(7) Alexandria leprosy clinic and its 6 branches at Damanhour, Idko, Mahmoudieh, Rosetta, Shobrakheet and Abu-Hommos.

(8) Minia leprosy clinic and its 4 branches at Beni-Mazar, Abu Kirkas, Samallut and Mallawy.

(9) Soubag leprosy clinic and its 4 branches at Tima, Akhmim, Tahta and Girga.

(10) Qena leprosy clinic and its 4 branches at Luxor, Kous, Dishna and Nag Hamadi.

Abu-Zaabal Leprosy Colony.

The number of patients isolated in the colony at the end of 1942 was 304.

In order that a colony such as that at Abu Zaabal which is situated a long way from habitation may flourish, it is necessary that inmates undertake such domestic activities as may be needed for their maintenance and provision, without outside assistance except in rare urgent circumstances. To insure this, some technical posts were created in the budget of the colony, namely for a tailor, a shoemaker, a carpenter, a painter and a mason. On the one hand, these will undertake the technical work required by the colony and, on the other, will train able patients in these occupations.

Mention was made that the waste land surrounding the colony was levelled by the inmates and utilised in growing vegetables for them. Another site, apart from the first, is being prepared for the cultivation of vegetables for the staff of the colony. Healthy persons are engaged in this work. In view of supply difficulties arising from the war, a cooperative society was formed to supply the staff with commodities at reasonable prices. A canteen was also provided to supply patients with refreshments.

As an encouragement to patients, it was decided this year to grant a monthly allowance to patients who look after crippled inmates or who perform other work, *e.g.* agriculture, carpentry, tailoring, etc. This was much appreciated by the patients who now feel that they are no longer in detention. Life in the colony is now almost normal.

The workshops were very active during the year. Some 1,300 pairs of shoes, and 3,200 pieces of garments were made for lepers in the colony and the Cairo hospital — thus it was possible to dispense with supplies of both items from central stores. The carpentry shop made all huts, doors, sheds, etc., that were required in the wards. The other workshops similarly carried out all that was required for the colony.

Cairo Leprosy Hospital.

Out of 293 patients consulting the hospital in 1942, 210 were diagnosed positive for leprosy. The remaining 83 suffered from other skin diseases and were referred to the special hospitals. Out of 180 contacts examined, 2 were returned positive for leprosy and the remaining 178 were put under observation to be examined once every three months.

A total of 1,319 patients attend the hospital branches at Imbaba, Karamidan and Kalioub and are treated for leprosy and other accompanying diseases.

A school was created in the hospital in September 1937 to teach the children reading, writing, arithmetic, religion, etc. A radio was provided for the recreation and entertainment of the patients. Materials for needlework were supplied by the Ministry to keep the patients occupied. The patients were able to make garments for themselves as well as other works of embroidery.

Out-Patient Clinics.

Besides the Abu Zaabal colony and the Cairo hospital, there are 8 principal out-patient clinics in the chief towns of provinces with four branch clinics attached to each. The medical officer and staff proceed to the branch clinic by means of a car suitably equipped for examination and treatment purposes. The staff can also reach these branches by train in case the car is not working.

Patients.

The number of patients attending all the anti leprosy clinics during the year was 1,586 as against 1,387 in 1941. Of this number 825 patients suffered from leprosy as against 728 last year. The rest were found suffering from other skin diseases and were referred to the competent hospitals.

The number of patients who were examined since the anti leprosy campaign was first started in March 1929 up till the end of December 1942 in all the leprosy clinics and branches was 20,584 of which 9,979 were returned positive for leprosy. However, 2,413 of this number were recorded in more than one clinic leaving 7,566 lepers proper.

Treatment.

Besides treatment of leprosy, the unit medical officers treat also any other accompanying disease which lepers may have contracted. A dentist and an ophthalmologist visit Abu Zaabal leprosy colony and Cairo hospital once a week.

Drugs used in the Treatment of Leprosy.

- (1) Hydnocarpus oil.
- (2) Iodised ethyl ester of hydnocarpus oil.
- (3) Non-iodised ethyl ester of hydnocarpus oil.

These are injected intramuscularly once or twice a week. Treatment is begun by a dose of 0.5 cc. which is increased by 0.5 cc. every injection until a maximum dose of 5 cc. is reached. This is then maintained. The hydnocarpus oil proved to be the most effective, besides having the advantages of causing no irritation of the tissues and being the cheapest.

Surgical Operations.

When necessary, the medical officers of Abu Zaabal colony and Cairo hospital undertake such surgical operations as may be required by the lepers, *e.g.* hernias, piles, calculi of the bladder, etc.

Chapter XI.—VENEREAL AND SKIN DISEASES

The number of patients who attended the Venereal and Skin Diseases Clinics during the year for treatment and were found suffering from one or other of these diseases was 168,074 as against 148,194 in 1941. This increase is due to: (1) the opening of two new Venereal Diseases Clinics at Assuan and Boulaq Health Group, (2) the fact that wars are generally great factors in the increase of venereal diseases, and finally (3) the public's appreciation of the services rendered by these clinics and their increased attendance in consequence.

The number of attendances during the year under review was 548,545 as compared with 636,503 in the previous year.

I.—GONORRHOEA

The number of patients suffering from gonorrhœa during the year amounted to 30,702, as against 35,535 in 1941.

There are, however, two evident clinical phenomena in gonorrhœa.

Whereas the incidence of acute gonorrhœa is predominant among men, chronic gonorrhœa is predominant among women. This is chiefly due to two causes; one pertaining to the patient and the other to the disease itself. The first may be explained by the shyness of women to disclose their infliction on the onset of the disease particularly in public clinics. They are, besides, less appreciative of the consequences than men with the result that they seek treatment only when the disease becomes chronic, or when their quack remedies fail. Moreover, the disease is less painful in women.

No accurate estimate can be made of the actual number of gonorrhœa cases in Egypt owing to the absence of legislation providing for the compulsory notification of venereal diseases.

A project-law has, however, been drawn up for the protection of offsprings against venereal diseases which, when promulgated, will enable us to arrive at an approximate estimate of the number of venereal diseases cases. The project law is now under the consideration of the legislative authorities.

II.—SYPHILIS

The number of patients suffering from syphilis during the year was 15,147, which is about their number in 1941 (14,954).

Table No. 69 shows that the primary, secondary, latent and nervous forms of syphilis are a little more or about the same as those of 1941. The cases of tertiary and hereditary syphilis have comparatively decreased than last year.

III.—OTHER VENEREAL DISEASES

The number of patients suffering from other venereal diseases amounted to 119,847 as against 68,372 in 1941, or an increase of 75·2 per cent.

IV.—DISCONTINUATION OF TREATMENT

The ratio of patients of both sexes who discontinued treatment was 37·4 per cent for gonorrhœa and 35·9 per cent for syphilis. It is, however, hoped that by the publication of the law dealing with the protection of offsprings against venereal diseases, these ratios will be reduced to a minimum.

The reasons for discontinuation of treatment are chiefly the disappearance of acute pains in gonorrhœa after a short period of treatment and the patients underrating the consequences.

V.—TECHNICAL WORK

The Social Hygiene Department published in 1942 a reference book demonstrating clinical diagnosis and treatment of the different stages of each of the venereal diseases, for males and females.

This book was responsible for co-ordinating and uniforming the technical work in clinics.

Chapter XII.—MENTAL DISEASES

Patients.

The patients remaining on December 31, 1941, numbered 4,444; new admissions in 1942 numbered 2,499 (1,607 males and 892 females) as against 2,454 in 1941. Therefore the total number of cases treated in 1942 amounted to 6,943. Out of this number, 3,004 cases were discharged or died thus leaving 3,939 patients.

Accused Patients.

The number of accused persons sent by the Procurer General for examination and report was 219. The Parquet also asked for reports on 51 cases admitted as ordinary patients. Among the patients sent for examination 39 persons were accused of murder or attempted murder.

The number of accused and criminal patients in residence up to December 31, 1942 amounted to 882.

Pellagrous Admissions.

608 cases suffering from pellagra were admitted during the year under review (427 males and 181 females) as against 585 cases in 1941.

Treatment.

(1) The Wasserman reaction tests were carried out in the Central Laboratories of the Ministry. Specimens of cerebro-spinal fluid were also taken from patients where this was necessary.

(2) 12 cases were treated in the out-patient clinics.

(3) In the Dental and Ophthalmic Departments, a great number of patients was treated.

(4) The number of cases treated locally from physical ailments amounted to 13,221.

(5) 193 X-Ray films were taken and screening was made for 104 cases.

(6) Shock therapy by the use of cardiazol or tetracor was carried out on 89 males and 72 females. Of these, 131 cases were of the schizophrenic reaction-type, 40 cases of which recovered or markedly improved, 42 improved slightly, while the rest showed no change. 16 other cases were of the manic depressive-type and out of these 7 recovered or markedly improved, 4 improved slightly, while the rest showed no change. 11 cases were confusional in type, and out of these 4 cases recovered or markedly improved, two others showed slight improvement, while the rest did not respond to treatment. The remaining 3 cases were suffering from paraphrenia and showed no improvement.

Suicides.

Fortunately no suicides or attempted suicides have taken place during the year under report.

Births.

8 children were born during the year in the female wards.

Medical Commissions.

(1) *Central Medical Commission.*

67 officials and employees were sent for examination, 21 reports were sent on inmates of the hospitals.

(2) *Military Medical Board.*

29 members of the Army Forces were reported upon during the year.

(3) *State Railways Medical Board.*

21 employees were sent for medical examination. 3 reports were sent on inmates of the hospitals.

Lectures.

During the year, the Director of the Division delivered lectures to the senior students of the Faculty of Medicine, Fouad I University. Other lectures to the doctors attending the Postgraduate course of Psychological Medicine and Neurology were also given by the Director of the Division and the Director of Khanka Mental Hospital.

Part IV.—TREATMENT

Chapter XIII.—GENERAL HOSPITALS

Hospitals in Operation.

A total of 72 general hospitals under the control of the Ministry were in operation during the year. Of these, 20 were in the Governorates and Chief Towns of Provinces, and 52 in Bandar towns and districts. There were in addition four out-patient clinics.

Hospital Accommodation.

The total number of hospital beds this year was 6,880 of which 5,988 were reserved for the patients and 892 for the personnel.

Treatment.

In view of the prevailing war time conditions, part of the hospital accommodation was reserved for emergency cases. A total of 95,587 patients were treated in the in-patient departments and 2,375,913 in the out-patient departments. The latter attended treatment 2,258,883 times.

Surgical Operations.

Surgical treatment in hospitals is progressing satisfactorily. The number of surgical operations performed this year was 33,007 in the in-patient departments and 79,524 in the out-patients making a total of 112,031 operations as against 30,890, 81,781 and 112,671 operations respectively in 1941.

X-Ray Examinations.

The number of cases examined and treated by X-Ray this year was 26,746 as against 30,226 in the previous year.

Deaths.

The number of deaths amongst patients treated in the in-patient departments was 7,248 from a total of 95,587 patients, *i.e.* 7.58 per cent.

Chapter XIV.—OPHTHALMIC HOSPITALS

New Units.

During this year, an ophthalmic department was provided within the Boulac Health Group, Cairo.

Ophthalmic treatment was also provided at the following towns:—

Tema.

El Bagour.

Sobk el Dahhak.

Shamma.

Thus the number of ophthalmic units reached 94 (of which 79 are permanent and 15 travelling). Ophthalmic treatment is being extended to all parts of the country according to a constructive scheme which is being gradually executed.

Clinical Work.

The following table No. 71 shows the clinical work done during the year 1942 as compared with that of 1941.

TABLE NO. 81

	1941	1942
New patients	1,431,858	1,303,949
In-patients	36,272	32,233
Operations	327,529	291,611
Out-patients attendances	8,970,642	8,110,014

The number of patients who were found blind in one or both eyes, excluding cataract cases causing blindness, was 57,862, *i.e.* 4·4 per cent of all patients examined at the ophthalmic hospitals. By adding the cataract cases causing blindness, this percentage becomes 4·6 per cent.

Acute ophthalmias form 82 per cent of all causes of blindness. The gonococcus is still the predominant factor of infection with acute ophthalmias, its ratio to total microbes being 4·1 per cent.

Age of Patients.

Out of 1,303,949 new patients treated during the year, 91,420 or 7 per cent were under the age of one year; 427,780 or 32·8 per cent from one to 15 years of age; 335,423 or 25·7 per cent from 16 to 30 years of age, and 763,203 or 58·5 per cent from one to 30 years of age.

School Clinics.

Ophthalmic examination, inspection and treatment of pupils are, at present, carried out in 40 Primary Government Schools in Cairo, Alexandria and the Provinces.

A total of 13,172 pupils were examined, of whom 98·5 per cent were found suffering from trachoma in its various stages. About 32 per cent of these were in the serious stages of the disease (Trachoma I and II).

As a result of ophthalmic treatment, the latter percentage fell to 13 per cent.

In this connection it is to be noted that the most accurate estimate of the prevalence of trachoma among pupils, can be obtained in government schools.

There the examination and treatment are carried out in a regular and permanent manner on pupils who are under the constant supervision of the treating doctors.

Other Services.

Ophthalmologists also pay regular visits to other hospitals and institutions to examine and treat eye cases, *e.g.*

The Leprosy Colony and Hospital at Abu Zaabal and Syufia, Cairo.

The Mataria Children Dispensary.

The Fever Hospitals at Abbassia and Embaba.

The Mental Hospitals at Abbassia and Khanka and Home for Weaned Babes at Zeitoun.

In addition to these services, ophthalmologists are occasionally sent to the Frontier Districts to examine and treat the inhabitants.

An ophthalmologist also accompanies the Medical Mission sent to the Hedjaz during pilgrimage to examine and treat pilgrims of all nationalities.

Accommodation.

The number of beds in all the ophthalmic units was 2,146.

Post-Graduate Course of Ophthalmology.

15 medical officers of the Ophthalmic Section attended this course in 1942; of these, 10 were examined in April 1942 in the preliminary course and all passed and 2 in October and 1 passed.

5 medical officers were examined in November 1942 in the final course and 4 passed.

Modern Apparatus and Instruments in Ophthalmic Hospitals.

Ophthalmic hospitals are kept supplied with modern apparatus and instruments to keep pace with new developments in this field.

Chapter XV.—PHARMACIES

Private Pharmacies.

The Ministry granted this year 4 permits for new pharmacies owned by local subjects, 3 of whom are qualified pharmacists and the fourth is not a pharmacist. Three pharmacies owned by non-pharmacist foreign subjects were closed.

The total number of existing pharmacies is 493, of which 410 are possessed by Egyptians (265 by qualified pharmacists and 145 by non-pharmacists) and 83 are possessed by foreign subjects (46 by qualified pharmacists and 37 by non-pharmacists).

Pharmacies Annexed to Health Offices.

During 1941, there were 14 of these pharmacies; one was closed in 1942, leaving 13 in operation. These pharmacies are annexed to health offices in districts having no pharmacies for the purpose of dispensing medicine to the inhabitants.

Cairo Night Service Pharmacies.

The number of night service pharmacies in Cairo remained the same in 1942 as in 1941, *i.e.* 7 in number. These dispensed 7,865 prescriptions during the night, as compared with 6,357 prescriptions in 1941. Specialities and patented medicines which are issued without prescriptions are not included.

Students of Pharmacies.

During 1942, 58 students of the Egyptian School of Pharmacy and 4 of Foreign Schools have been authorised by the Ministry to pass the statutory period of training in pharmacies, as compared with 47 of the Egyptian School and 22 of Foreign Schools during 1941.

Simple Drug Stores.

Three permits were granted by the Ministry for simple drug stores (2 in Menoufia and 1 in Girga). No such stores were closed down during the year.

Poisonous Drug Stores.

No permits for dealing in poisonous substances were granted to drug stores during the year; two permits were cancelled (1 in Cairo and 1 in Alexandria). Twelve permits were granted for trading in agricultural and industrial substances (3 in Cairo, 5 in Alexandria, 1 in Sharkia, 2 in Menoufia and 1 in Gharbia) and three permits were cancelled (1 in Cairo, 1 in Alexandria and 1 in Assiut). No permits were granted for trading in Narcotics.

Medical Practitioners who prepare drugs in their clinics for their Private Patients.

Gharbia	5	Behera	3	Menoufia	3
Dakahlia	1	Kaliubia	3	Giza	1
Fayoum	1	Beni-Suef	1	Minia	1
Girga	1	Qena	1					

Total = 21 throughout the country.

Registration of Egyptian Specialities.

During the year, 119 permits for preparation and sale of Egyptian specialities were granted and 23 specialities were refused registration.

The actual number of Egyptian specialities registered in the Ministry is 687.

Laboratories Manufacturing Pharmaceutical Preparations.

The Ministry granted 21 permits for laboratories manufacturing pharmaceutical preparations (18 in Cairo, 1 in Kaliubia, 1 in Gharbia and 1 in Gîza).

Contraventions to Law.

The number of contraventions brought by the Ministry before the Courts amounted to 298, of which 137 were for trading in poisonous drugs without permits, 24 for practising pharmacy without authorisations and 82 against pharmacists and assistant-pharmacists.

TABLE NO. 82.—SHOWING QUANTITIES OF STUPEFACIENTS IMPORTED INTO EGYPT AND EXPORTED THEREFROM DURING 1942

Chapter XVI.—BILHARZIA AND ANKYLOSTOMA

New Units.

During this year, the following units were opened :—

- (1) Travelling Ank. and Bilh. Hospital No. 35 opened in Edfu on July 18, 1942.
- (2) Ank. and Bilh. Branch opened on December 16, 1942, at Ayat District Hosp.
- (3) Ank. and Bilh. Branch opened on December 31, 1942, at Shubrakhit Dist. Hosp.

The total number of all units is thus 90 of which 6 are Stationary, 44 Travelling, 24 Branches in District Hospitals and 16 School Clinics.

Number of Patients Treated.

The following table No. 85 gives the number of new patients, doses of anthelmintics and number of injections given as compared with the corresponding numbers of the previous year (1941).

TABLE NO. 85

YEAR	New Patients	Number of Injections	Anthelmintic Doses	Observations
1941	1,013,704	3,611,757	342,316	Deficiency 25,623 Pts. Increase of 38,320 injections and 10,621 Doses.
1942	988,081	3,650,077	448,534	

The decrease in the number of new patients this year is due to the fact that 11 endemic diseases units were assigned to treatment of cases in Fayoum Province in connection with the Bilharzia eradication scheme. This, however, is balanced by a substantial increase in the number of injections given.

Treatment of Pupils.

47,145 pupils were examined.

9,244 anthelmintic doses were given.

100,292 anti-Bilharzial injections were given.

Treatment of the Territorial Force.

8,678 Territorial soldiers were examined during this year as against 11,834 in 1941.

48,015 injections were given during this year as against 84,261 injections given during the previous year.

5,495 Anthelmintic doses were given during this year as against 6,314 doses given during the last year.

Units Undertaking Treatment in Adjoining Localities.

The state of health among workmen in the Gebel el Asfar Farm and Main Drainage Department was so unsatisfactory that it was decided to treat them and their families for endemic and other diseases. The Ankylostoma branch in Shebin el Kanater Hospital was therefore transferred to the Farm towards the end of the year where 1,907 patients were examined and treatment provided.

Inducing Patients to Continue Treatment.

Despite repeated advice about the importance of completing Bilharzia treatment, it was observed that patients were apt to cease treatment soon after the disappearance of the acute symptoms. It was therefore decided to try the following two methods of inducement :—

- 1.—Providing a free midday meal to patients attending after the 6th injection.
- 2.—Free issue of shoes to patients on completing the course of 12 injections.

(1) The former method was adopted by the Ankylostoma hospital at Shebin el Kanatér and No. 6 Ank. Clinic at Tala, with the result that absenteeism was most observed in the intervals between the 1st and 6th injections, *i.e.* before the free meal was due. 37 per cent of all the patients continued treatment until the 6th injection. From the 7th injection up to the 12th the ratio of attendance rose to 60 per cent. A marked general increase in attendance of both new and old patients was observed during this experiment. In the light of these results, it was decided to provide free meals throughout the course of treatment.

(2) Taking advantage of the scheme for providing the poor with shoes, it was decided to present every patient who receives the full course of 12 injections with a pair of shoes. This was tried in No. 8 Ankylostoma Hospital at Helwan, with the following result.

Before the experiment: the ratio of patients completing treatment was 30 per cent. During the first six months of the experiment, the ratio rose to between 40-48 per cent. This ratio however fell to the normal average of 24 per cent during the last 2 months preceding the transfer of the hospital to Kirdassa where the experiment was resumed with a result of 26 per cent of the patients completing their treatment.

New Treatment Technique.

*Treatment of *Lambliia intestinalis* with Atebrin*

The patient is instructed to take a light supper and come to the hospital the next morning without taking any breakfast. Atebrin is then administered in half tablets at a quarter of an hour intervals until 2 tablets have been administered within three quarters of an hour. Four hours later, the patient is given a dose of magnesium sulphate. A week later, the patient is re-examined and treatment repeated to still positive cases.

Introduction of Intramuscular Injections in the Treatment of Bilharzia Patients with Invisible Veins.

The intramuscular injection of Fouadin and Anthiomaline was permitted where Tartar emetic could not be administered intravenously owing to invisibility of patients' veins.

Modification of Treatment Technique.

Abolition of Preliminary Purgatives

It was decided to abolish the use of the preliminary purgative given before the administration of Carbon Tetrachloride, it being sufficient to ascertain that the patient was not constipated.

Introduction of Arsenical Compounds in the Treatment of Amaebia.

It has been decided to give a supplementary arsenical (carbarson) treatment to acute dysentery cases under treatment with emetine or Enterovioform.

Revision of Technical Instructions.

All instructions previously issued to Units on admission, diagnosis and treatment of patients have been collected for the purpose of revision and publication in booklet form.

Compulsory Treatment of Bilharzia (Fayoum Region).

Reference was made in last year's report to the issue of the Anti-Bilharzia Law No. 58 in October 1941. The first snail extermination campaign was started in December of that year. The application of the Law to the Region by ministerial arrêté was however postponed until the extermination of snails was complete.

The distribution of the units to the districts to which the law is applicable was as follows :—

TABLE No. 86

Districts	Units	Date of Work
Gharak El Sultani	Hospitals Nos. 25 and 28	May 1942.
Sanhour El Baharia	Clinics Nos. 11 and 15	Sept. 1942.
Tatoun	„ „ 4 and 14 (will be transferred from Edwa).	
Lahoon	Hospital No. 19 (will be transferred to Shwashna) and Clinic No. 7.	

Each of the above four units was charged with the examination and treatment of an area of 30,000 of population.

Three other units were left to carry out treatment throughout the province namely, No. 4 Hospital in Fayoum Bandar, No. 14 Hospital in Sinnouris and an Ankylostoma branch in Etsa District Hospital.

The following is a summary of the work accomplished :—

Total of patients who started treatment	30,394
Total receiving 12 injections	28,876
Total receiving 15 injections	19,297
Total Number of injections given	340,770

Kom Ombo District.

All water-ways having been cleared of snails, the Anti-Bilharzia Law was applied and compulsory treatment is in progress.

Treatment of Malaria.

Laboratory assistants are being trained in the examination of blood specimens for Malaria instead of forwarding same to the Research Institute for examination, thus saving time and expediting treatment.

Treatment of Pellagra.

A total of 21,691 cases were diagnosed pellagra of which 16,313 were treated as compared with 14,740 cases diagnosed and 10,293 treated in the previous year.

Treatment of Pupils.

According to an agreement reached between the Ministries of Education and Public Health, parents of pupils will henceforth be required to give a declaration on the beginning of the school year accepting the examination and, if necessary, the treatment of their children for parasitic diseases. No pupil will be accepted in school before that declaration is produced.

Incidents of Poisoning.

During the year, 4 fatal cases of poisoning with Chenopodium oil were recorded. 2 cases of poisoning with Carbon tetrachloride were reported but these were treated and recovered.

Protective Measures and Propaganda.

The Ankylostoma and Bilharzia units spare no effort in driving home to the patients the great importance of completing the treatment course and in showing them the means of protection against parasitic infections. A total of 27,320 lectures were delivered to patients during the year.

The Relation of Certain Canals to the Spread of Bilharzia.

Canals which run through village habitations are closely connected with the spread of Bilharzia, e.g. Kased Canal in Tanta and Kafr Youssef Salama drain in Zankaloun Village. These two canals were inspected and recommendations made in conformity with agreements concluded between the Ministries of Public Works and Public Health.

Research Work on the Spread of Helminthic Infections in Certain Localities.

The population of certain localities namely Hosh Eisa, Abou Matamir and Wafaeiya (Behera Province) were examined with a view to determining the extent of Helminthic infection.

As a result, a unit was dispatched to the last place to undertake the treatment of the patients.

Post Graduate Studies.

During the year, two Medical Officers of the Ankylostoma and Bilharzia Units were delegated to attend a post graduate course in Tropical Diseases.

Chapter XVII.—BILHARZIA SNAIL DESTRUCTION

I.—*The Fayoum.*

A detailed description of the Province and its irrigation and drainage systems is given in the Annual Report of the Bilharzia Snail Destruction Section for 1942. The province was divided into small areas of 5,000 to 10,000 feddans and surveyed. The aim of the survey is to note accurately the location and the number of snails in a canal or drain in view of subsequent treatment. Stations are made along the canals; at each station 3 dips are taken by nets and the snails collected at every dip are recorded in the respective column of the survey books. Notes are also taken about other species of snails, weeds, length, width, depth of the stream, etc.

After treatment a second survey of the Province was made and showed a considerable decrease in the total number of snails found in infested streams. A decrease in the number of infested streams was recorded.

II.—*Treatment.*

Treatment of irrigation channels harbouring Bilharzial snails consists essentially of:—

- (1) *Clearance* of weeds by mechanical means such as hoes and nets. It is preferably done at the low water period of the irrigation rotation. The vegetation is dug up first and then floating debris, snails and eggmasses are dipped out with the nets.
- (2) *Sulphation*.—Copper sulphate is used in a concentration from 15–30 parts per million and left to act for at least 3–4 days. Sulphation is done in streams cleared from vegetation to minimize the absorption of the drug by organic matter and facilitate the dragging of the sacks of copper sulphate. The amount of sulphate required for the volume of water to be treated is filled into sacks of 10 Kgs. which are tied to the middle of a rope and dragged along the stream by two men placed on opposite banks of the stream.

III.—*Research.*

A number of experiments, most of them having an important bearing upon the destruction of snails, have been worked out, including:—

- (1) The Effect of Copper Sulphate on *Planorbis boissyi* and *Bulinus truncatus* in Environmental Ponds before Weed Clearance.
- (2) Life-span and Monthly Growth Measurements of *Bulinus truncatus* and *Planorbis boissyi*.
- (3) Revival after drying.
- (4) Experiment on the Self-fertilization of *Planorbis boissyi*.
- (5) Ecological studies.
- (6) *Cercaria vivax* and its development into *Prohaemistomum vivax*.
- (7) Random Examination of *Bulinus* Snails sent from Fayoum Province for Trematode Infections.

IV.—*Equipment.*

A good supply of hand-nets provided with stout wooden handles and covered with wire gauze of fine and large mesh, were made in the Government workshops. A small workshop for repair of nets and the making of small instruments and furniture such as could not be obtained through the stores was established in the Section. A quantity of Copper Sulphate was bought from the Imperial Chemical Industries as the local supply was insufficient.

Chapter XVIII.—MALARIA

The incidence of Malaria was slightly less this year than in the previous year.

The ratio of positive cases for both the new infections and relapses was 10·3 per cent in Lower Egypt and 4·3 per cent in Upper Egypt as compared with 10·5 and 4·9 per cent respectively in the previous year.

The general ratio of all malaria cases throughout Egypt was 8·9 per cent as against 9·06 per cent in the previous year, excluding the Gambia malaria epidemic which has invaded the southern part of Upper Egypt during the year.

A Permanent Station was created at Wadi El Natroun bringing the total number of permanent stations to 10. The number of travelling stations remained the same this year as in the previous year. Some outposts were, however, set up where these were required.

It was not possible to get Teh El Baroud and Abu Kebir stations ready during the year.

The following table No. 87 gives the distribution of permanent and travelling stations and outposts during the year.

TABLE No. 87

A.—Lower Egypt.

Behera...	{Edku Kafr el Dawar ...	Kafr el Dawar 3 (Not yet started)	Montazah. Nazlia. Busseili, Khorshed.
Dakahlia	Faraskour	{Kafr Abu Nasser 4... Dekernis Markaz ...	{Mansoura.
Gharbia	{Fowa Kafr el Sheikh ...	{Dessouk 5	{Shaba, Biala. Qulline.
Sharkia	—	Belbeis 2	{Faroukia El Magar. El Faridia.
Canal	Ismailia	—	{Abu Sweir, Nefisha, El Dabiya, Sarabium, Abu Soltan.
Suez	Suez	—	{El Koubry. El Shalloufa.
Kaliubia	—	Toukh 6.	—

B.—Upper Egypt.

Giza	Giza	—	Kafr Ghatati.
Fayoum	Fayoum	Abshawai 1	—
Wadi Natroun	Wadi Natroun	—	—
Frontier Governorates	—	—	{Oases of Baharia, Dakhla and Kharga.

Blood Specimens and Results of Examination.

Of a total of 142,370 blood specimens examined during the year, 12,794 or 8·9 per cent were returned positive for malaria for both new infections and relapses. Tables Nos. 88, 89 and 90 give the distribution of these specimens according to attendance at malaria units and branches, persons suspected of infection in their homes and persons undergoing a general examination. Table No. 88 deals with Lower Egypt, Canal and Suez Governorates, table No. 89 deals with Upper Egypt and Western and Southern Desert Governorates, and table No. 90 deals with Egypt as a whole.

Perusal of these tables shows that the ratio for the first category appears rather high, being 28 per cent in all Egypt, whereas it drops in respect of the second and third categories to 7·9 per cent and 3·2 per cent respectively. This is explained by the fact that attendance at the Malaria Stations and outposts more often than not are either suffering from symptoms of the disease or rise of temperature, whereas examination of the latter two categories is made for mere suspicion or to get an idea as to the trend of the disease.

New Malaria Infections and Relapses.

Of the total number of 12,794 positive cases, 3,529 were returned new infections by the Malaria Units and Branches or a ratio of 27·5 per cent of all positive cases, the remaining 9,265 being relapses. It is to be pointed out that the number of new infections is an indication of the degree of the spread of malaria mosquito carrier.

Malaria Incidence According to Age Groups.

Tables Nos. 91 and 92 show that the ratio of positive malaria cases is lowest during the first year of life. This being due to the fact that infections in early life are generally new whereas older children and adults are open to new as well as recurrent attacks.

Types of Malaria.

Of 11,397 positive malaria cases recorded in Lower Egypt and the Canal and Suez Governorates, 7,579 or 66·5 per cent were benign (2,120 new infections and the remainder relapses), and 3,818 or 33·5 per cent were malignant (1,153 new and the remainder relapses). No quartan cases were recorded.

Of the 1,397 positive cases recorded in Upper Egypt and the Southern and Western Desert Governorates, 705 cases or 50·4 per cent were benign (107 new and the remainder relapses), and 685 cases or 49 per cent were of the malignant type (148 new and the remainder relapses), 6 quartan cases were recorded in Fayoum and one in Baharia Oasis making a ratio of 0·6 per cent (of these one was new and the remainder were relapses). (*Vide* Table No. 93).

The total number of cases of malaria of the three types recorded throughout Egypt was 12,794 or 8·9 per cent of a total of 142,370 specimens—exclusive of cases occurring in the Southern provinces which were caused by the Gambia mosquito.

Monthly Incidence of Malaria.

Tables Nos. 94 and 95 give the seasonal incidence of malaria in Lower and Upper Egypt. It will be observed that the benign type is highest during June–September, whereas the malignant type is highest during November and December.

The incidence of the quartan type was sporadic in Upper Egypt during the last four months of the year.

Malaria Cases and Deaths notified in the Governorates and Provinces.

Table No. 96 gives the number of malaria cases and deaths notified to the Statistical Department during 1941 and 1942. It will be observed that there is a marked increase in the number of cases and deaths during 1942 than in 1941. This is attributed to the escape of the Gambia mosquito from the Southern regions to Upper Egypt which is the subject of a separate report elsewhere.

Detection of Mosquito Breeding Places.

Special attention was paid to breeding places of mosquitoes which carry malaria as well as of *Culex pipiens* larvæ and *Bilharzia* snails particularly in *Filaria* infected localities. Tables Nos. 97 and 98 demonstrate the extent of the work carried out in Lower and Upper Egypt.

Places where *Anophelines Pharoensis* or *Sergenti*, *bilharzia* snails or *Culex pipiens* breed were given first priority and were reported to the Department of Village Affairs for their extermination.

Control Measures.

The same control measures were adopted this year as in previous years. The control of mosquito larvæ of all species consisted of treating breeding places with insecticides. *e.g.* paris green or mazot, clearing of weeds, drainage of stagnant water and filling in of burrow-pits and small subsoil water collections. A total of 588·850 kilogrammes of Paris Green and 71,799 kgs. of mazot were used this year in both Lower and Upper Egypt. (*Vide* Table No. 99).

Permanent control measures are undertaken by the Department of Village Affairs and consists of filling in of breeding places. During 1941-1942, 65 birkas of a surface area of 50 feddens, 14 kerats and 18 sahms were filled in. These required a total of 265,389 cubic metres of earth which cost L.E. 25,873·850 mms. as shown in tables Nos. 100 and 101. During 1942, 57 birkas of 89 feddans, 4 kerats and 23 sahms surface area were filled in requiring 473,268 cubic metres of earth and costing L.E. 41,507·600 mms.

Other breeding places falling within the property of the E.S.R. the Irrigation Department or other Government Department, were reported to these authorities with a view to their eradication or clearance. In addition to filling in work, the Department of Village Affairs reconstructed the covered drain passing through Zerbi village, Sennouris Markaz, for the drainage of infiltration water. The work was started on January 21, 1942, and a sum of L.E. 695·424 mms. was provided by the Higher Malaria Commission for the purpose. The drain is built of concrete piping 587 metres long and 20 cms. in diameter, joined together by clinker boxes. A shield of gravel 0·75 meter high and 0·15 metre wide was built along the drain for recovering infiltration water. 4 inspection chambers were also built along the drain.

Filariasis (Elephantiasis).

Research work was confined this year to Fareskour area, Dakahlia Province. Some 565 blood specimens were taken of which 15 or 2·65 per cent were returned positive for filariasis. *Culex pipiens* were detected in certain drains in that area.

Treatment and Drugs.

Drugs were distributed to all malaria patients who were examined microscopically. Table No. 102 gives the total amounts distributed of each of these drugs, in both Lower and Upper Egypt.

Anti Malaria Law No. 1.—Rice and Sugar Cane Cultivation.

The Law was not applied this year to any localities other than those to which it was previously applied and where it is still in force.

Propaganda.

The public were again instructed in the symptoms of malaria, the causes of its propagation, the methods of treatment and the means of protection.

Complaints.

All complaints received due attention, especially those concerning the existence of marshes in proximity to habitations or the prevalence of mosquitoes. Where the complaints dealt with stagnant water, growth of weeds or infiltration water, the respective inspections of irrigation were notified for action. The E.S.R. and other Departments were also approached with regard to burrow-pits within their properties.

Researches in regard to Rice Cultivations.

The researches which had been started in 1939 were continued this year. Special areas and localities being selected for the purpose. A 1 per cent Paris green compound was used for dusting irrigation water just before entering the rice cultivation. In this way, an even amount of insecticide is carried with the irrigation water to all parts of the field. The procedure was the same as adopted during the past three years. By this method, it was possible to reduce the amount of Paris green from 6·4 kgs. to 5 kgs. per feddan, and at the same time obtain the same effects on anopheles.

Part VI.—RESEARCHES AND LABORATORY EXAMINATIONS

Chapter XIX.—SUMMARY OF THE WORK OF THE DEPARTMENT OF PUBLIC HEALTH LABORATORIES

1.—*Bacteriological Section.*

The total number of specimens examined bacteriologically in the Central, Provincial and Branch Laboratories, during the year 1942 was 546,391.

2.—*Pathological Section.*

1,688 specimens were examined during the year under review in this section and the Branch Pathological Laboratory, Alexandria.

3.—*Chemical Section.*

The total number of samples examined chemically in the Central Laboratories, Assiut and Tanta Chemical Laboratories during the year 1942 was 105,098.

4.—*Water Section.*

(a) Bacteriological Service.

The total number of samples of water, aerated water, ice and syrup examined by this section, during the year 1942 was 8,665.

(b) Chemical Service.

During the year, some 609 samples of water have been subjected to chemical analysis.

5.—*Antirabic Institute and Hospital.*

During the year 1942 — 7,217 patients attended the Institute; out of these 6,958 were fully treated.

6.—*Serum and Vaccine Institute.*

The following vaccines and sera have been prepared during the year 1942 :—

(1) T.A.B.	865,955	ccs.
(2) Anti-Plague vaccine	...			11,525	„
(3) Cholera vaccine		62,375	„
(4) Diphtheria prophylactic (Formol Toxoid)	...			23,175	boxes, each box for one person.

(7) Serum Anti-Tetanus	11				litres.
(6) Anti-scorpion serum	16				„

Chapter XX.—FOUAD I INSTITUTE AND ENDEMIC DISEASES HOSPITAL.—PARASITOLOGY DEPARTMENT

A.—Schistosomiasis

The Destruction of Snails by the Chemical Method

Based upon experiments done previously in the Laboratory (Khalil, 1924) ⁽¹⁾ and in the Dakhla Oasis (Khalil, 1927 and 1929) ⁽²⁾ where a successful attempt at eradication of the snail intermediate host of *Schistosoma haematobium* with copper sulphate was made, another attempt was made in a vast area on a basis which differs in technique from the previous one. The object of this attempt was, in the main, as follows:—

- (1) To eradicate the snail intermediate host on a large scale by the chemical method.
- (2) To determine the cost of the chemical method of snail destruction.
- (3) To compare the chemical method with the clearance method.

The area chosen was Teftiche Wadi Kom-Ombo, Aswan Province, Egypt. This Teftiche covers an area of 30,000 acres of cultivated land, and is irrigated all the year round by a system of about 90 canals and branches, all of which are supplied from a main big canal called "Canal Cassel." The water is raised to this canal by means of 4 pumps directly from the Nile. The lengths of these canals, "Cassel" excepted, exceed 200 kilometres and their tributaries, most of which were also treated, exceed the figure of 1,000 kilometres.

An expedition composed of one doctor and 5 experienced assistants was sent early in 1940. About 200 stations for examination were established on the canals, mainly at the head and tail of each. The examination was carried out: (a) before the treatment to determine the degree of infestation with the snails and to find out the canals, if any, not requiring treatment; (b) about 3 weeks after the treatment to determine the immediate effect of the method and (c) at intervals of one month, when possible, or of two months, to determine the stability of the method and to fix data for future treatments.

Method of Examination.

A method of examination of the canals in question for snails had to be devised. It should be uniform in all canals, should also give reliable results and lastly it should be quick and easily carried out, as the area in question was large and the means at the disposal of the expedition were limited. Such a method of examination complying more or less with these requirements was found in a trap made of a freshly cut branch of a palm-tree. This is available in every locality in Egypt. It was submerged under the water by fixing it to a piece of stone to allow it to rest on the bed of the canal. The branch was fixed to a piece of string, the other end of which was fastened to some object on the edge of the canal. The trap was left in that condition between 5-7 days of irrigation, after which it was carefully raised from the water and all snails found on the leaves were sorted and counted. A series of tests were made to determine the reliability of this trap and the results were satisfactory, allowing for a margin of error amounting to 10-15 per cent. Reference regarding this trap is found in the account given below, pages 125-127.

The preliminary examination of the locality by this trap at the two hundred stations was made during the month of April, 1940. The result of this examination is found in Khalil-Bey and Hulmy (1940) ⁽³⁾ table 2, pp.733-739. The conclusion reached from this preliminary examination is summarized in the following:—

- (1) All miskas in which *Potamogeton crispus* is found should be treated, whether or not snails have been found in them.
- (2) All miskas drawing their water from the lower third of a canal infested with *Bulinus* should be treated.

- (3) Large ponds formed at the head of miskas and caused by the rush of water from the supplying canal should not be overlooked.

The following miskas should be left untreated:—

- (1) Miskas in which only *Physa* or snails other than *Bulinus* can live.
- (2) Miskas with sandy and clean beds, and also those which are very shallow, and which usually completely drain their water at the end of every period of irrigation owing to their high level.
- (3) Miskas supplying areas of land not to be cultivated before the lapse of a few months, the so-called "fallow land."

Technique employed.

A special technique has been devised and is explained in some detail (*loc. cit.* p. 740). It is applicable under the following two fundamental conditions:—

- (1) The canals must be practically empty at the commencement of the treatment.
- (2) The addition of the copper sulphate is made at the time when the canals are refilled.

The work was thus rendered much easier, and it was possible to complete it in a very short time.

The copper sulphate was added in dry form and the outfit required was composed of: 30 air-raid-precaution sand bags, 15 calico bags of each of three different sizes, one of which fits the sand bags, 12 iron or wooden wheels, a quantity of ropes and strings and a few poles. The bags contained, when full, 1 to 16 kgs. of the dry drug.

The bags, filled with the appropriate amount of the drug, were placed at certain chosen points on the canal in such a way that the incoming water passes through them. Special consideration is given to: (a) the amount of water passing; (b) the time required to fill the canal to the desired level and (c) the diameter of the canal at the selected point. It was thus possible to have the contents of a bag of 16 kgs. completely dissolved in from 15 to 180 minutes.

In canals with regulating bridges the technique followed was different from that used for canals without regulators. For the latter a simple formula has been made.

It has thus been possible to obtain a fairly even distribution of the drug at the end of the process of treatment.

Both at the commencement of the treatment and immediately after concluding it, every water outlet, whether to or from the canal, must be closed and remains so during a period of 5 days from the start.

At the end of this period the canals were reopened for irrigation without further restriction.

To avoid interception by the vast number of miskas occurring between the different canals, the latter were divided into 16 groups, separated from one another by large drains. Each group was treated in a single day, with a few exceptions.

Chemical examination of the water at the conclusion of the treatment was made to check the distribution of the drug. It was, however, not continued throughout the campaign, as certain difficulties arose.

Other difficulties encountered were:—

- (1) Several of the snail traps were lost, and in some cases this occurred more than once at the same station. This question should receive due attention. The traps should be placed in such a way as to escape the notice of passers-by.

- (2) Our movements along the canals, which was frequently necessary, was greatly limited owing to slow means of communication. A motor-cycle rendered valuable service during the preliminary survey. The motor-trolley, so kindly put at our disposal by the Company, was very useful.

- (3) It has been intended from the start to close and seal all gates on the head of each canal and inspect the seals regularly during the 5-days period. Lack of time and personnel prevented us from carrying out this plan to the letter. Inspection, which was done occasionally, revealed certain indiscriminate actions which had a deteriorating effect on the result of the treatment of some canals. Chaining and locking the gates is advisable.

(4) Big-disappointments have been met with in the treatment of a few canals, which were apparently empty at the start of the treatment, although they contained large amounts of water in their distant, lower portions. Such water collects at the tail of the canal, which is usually more infested with snails, and remains free of the drug. Unless this is guarded against, a complete failure is certain. It is therefore advisable not to rely on outside information as to the state of the canal prior to treatment.

Immediate result of the Treatment.

Three weeks after the treatment of the canals, about 40 stations were re-examined by the snail trap. The result is given in the following table, together with the result prior to treatment.

TABLE No. 103

b. = broad.

l. = large.

m. = medium.

s. = small.

(1) This number is usually not given in negative cases.

(2) *Planorbis laurenti*. *P. boissyi* is not present in this locality.

A study of the previous table shows clearly that:—

- (1) Physa is almost completely eradicated from the canals treated.
- (2) Bulinus was eradicated from 14 out of 41 stations examined.
- (3) A reduction of from 50-100 per cent of Bulinus was achieved in most of the stations.
- (4) In 5 out of 41 stations the treatment must be considered to have failed and their corresponding canals have accordingly been treated again.

From the effect on Physa it is concluded that in every case the drug reached its destination by the technique employed.

Regarding Bulinus, two probable conclusions have been drawn. The first was that the distribution of the drug was markedly not even, and the second, that the dilution of 5 per million was not sufficient to kill all the Bulinus-snails.

One or both of these two possibilities might have been the cause of the incomplete success achieved, or failure suffered, in these few canals. While it is not intended to exclude the occurrence of a certain extent of uneven distribution, the unsatisfactory result in these canals is attributed mainly to the insufficient amount of drug used. This is made evident in five experiments carried out in the laboratory on a large number of snails. The result of these experiments⁽¹⁾ shows that not all the Bulinus snails, especially the large forms, succumb readily to the action of the drug at the dilution used (5 per million). To this is added that canals in which the chemical examination gave a concentration of the drug calculated at about 7 per million became absolutely free from non-operculated snails.

It is therefore suggested that a concentration of 6-7 per million might be used in future with an addition of 1 per million for a would-be uneven distribution.

The failure in the 7 canals referred to above is also partly attributed to the difficulties encountered and mentioned before.

The Effect of Copper Sulphate on Potamogeton crispus.

Generally speaking, no deteriorating effect of the drug on *Potamogeton crispus* was observed. Only in 2 cases, where a concentration as high as 20 per million was approached, did this plant disappear completely from the canal bed.

The Effect of Copper Sulphate on Man and Animal.

No ill-effects have been observed during the campaign on man or animal, although many people reported that they have used the treated water for drinking and other purposes.

Delayed urination was, however, observed in some camels which drank from an isolated locality especially reserved to test the effect of high concentrations of the drug on *Potamogeton crispus*.

Effect of Copper Sulphate on Agriculture.

As for agricultural plants, there is no question of any harm that might be caused to them by the drug. The treated canals are closed for irrigation during the period of treatment. At the end of this period only a trace, less than half per million, is found in the water, as the drug is gradually eliminated from the water by natural process. Moreover, on resuming the irrigation, the incoming fresh water dilutes the water-content of the treated canal to such an extent that it will be practically impossible to trace the drug in the irrigation water.

⁽¹⁾ Vide Khalil Bey, M. and Hilmy, I. S. (1940), J. Roy. Egypt. Med. Assn., p. 766-769.

Canals Free from Snails.

Branch 3 Cassel Kebli and Canal Suarez with its six branches were the only canals found free from snails. The water of these canals was examined chemically and a trace of copper in a soluble form was found in it. As the first of these canals receives its water directly from the waste-water pipe of the sugar factory of Kom Ombo and drains it to Canal Suarez, a sample of the canal bed near the waste-water outlet of the factory was collected for chemical examination. It was found to contain 150 milligrams of copper in an insoluble form in every 100 grams of the dried sample. This copper originates from the bronze boilers of the factory during their grinding. Certain conclusions are drawn from these findings and further examinations are in progress.

Re-Examination.

Three months after the work was concluded, the area was inspected again and many of the canals were examined by the wire-net, with good results. *Potamogeton crispus* disappeared completely. This is evidently due to the action of the flood-water as it usually occurs every year. It was also not possible to obtain any snails, or only a few could be found, by means of the net in places where this was easy and large amounts could be secured before the canals were treated.

It was decided, therefore, to examine, by the snail trap, some 22 stations and the results are given in the following table.

TABLE No. 104

Station number	No., rel. size of palm-leave			No. of Bulinus			No. of Physa

172	133 m	—	—	47	neg.	neg.	774	neg.	neg.
176	110 m	114 m	112 m	50	25	32	510	neg.	1
179b	—	(2)	98 m	8	(2)	neg.	2	(2)	neg.
190	83 m	43 m	106 m	280	6	3	30	neg.	neg.

(1) This number is not given in negative cases.

(2) Not examined by the snail trap immediately after treatment.

(3) All snails of a large size.

(4) All snails of a small size.

The above table shows a further reduction of the snail population in all but 5 stations. This improvement could not be attributed to the action of the flood water, as in the case of *Potamogeton*, but rather to the treatment the canals have undergone. Best evidence for this is obtained by considering the result in the 5 stations mentioned above. Special reference is also made to another station (No. 14), which gave a number of 67 *Bulinus*-snails, all of which of a size not exceeding two millimetres. Had the flood water had any detrimental effect on the snails, such young forms would not have been able to escape their fate. When to this is added the result of the other 5 stations, in which the number of snails remained stationary or even increased, it may be safely concluded that a direct action of the Nile flood on the snail-population of irrigation canals does not exist.

The Cost of the Chemical Method.

Following is a detailed list of all expenditure which have been made during this campaign.

TABLE No. 105.—EXPENDITURE

Kind	Total		Cost per acre in milliemes (1)	Borne by
	L.E.	mills.		
Copper sulphate 2·91 tons	120	598	4·0199	Kom-Ombo Company.
L.E. 41·4 per ton				
Delivery Kom-Ombo				
March 1940				
Labourers	15	440	0·5147	Kom-Ombo Company.
Assistants	61	360	2·0453	Government.
Utensils	10	059	0·3353	8·244 K.O. Co. 1·815 Govern.
Total cost	207	457	6·9152	

(1) 1 millieme = 1/48 shilling or 1/250 dollar.

The above expenditure did not include the salary of the M.O. in charge of the campaign. This had been calculated at L.E. 0·001 to every acre. It should also be borne in mind that the price paid for copper sulphate was high, due to the war and that in future it will be reduced to about 50 per cent; this will make out for any additional increase in expenditure such as the M.O.'s salary and the increase in the amount of copper sulphate to be used in future.

Progress of the Treatment.

Result during the Two Years Following the Treatment.

The further development of snails in this area during two years following the application of copper sulphate is shown in graphs I, II and III, which show the result of a 2-monthly examination of the canals in question. Graph I shows that, after an abrupt reduction of the *Bulinus* population in the canals to 2·4 per cent in June, 1940, the improvement continued until the month of November of the same year (0·6 per cent) as compared with a control area where the corresponding figures were 100 per cent and 27·5 per cent respectively.

After November, 1940, the number of snails began to increase steadily until it reached its maximum of 9·3 per cent in June, 1941 (Graph II). The last examination of these stations was concluded towards the middle of July, 1942 (Graph III); the number of snails was then found to be 6·5 per cent, compared with 2·0 per cent in July, 1940, and 6·3 per cent in July, 1941.

Table No. 106 shows the percentage of snails obtained during the corresponding month of the two-years period :—

TABLE NO. 106.—COLLECTIVE STATE OF THE CANALS DURING TWO YEARS
FOLLOWING APPLICATION OF COPPER SULPHATE

Months	1940	1941	1942
March	—	5%	2·5%
April	22°%(¹)	4%	5%

GRAPH II.

Copper sulphate method. Teftiche Wadi Kom-Ombo, Egypt. First post-treatment year. Explanation as in graph I.

GRAPH III.

Copper sulphate method. Teftiche Wadi Kom-Ombo, Egypt. Second post-treatment year
Explanation as in graph I.

Comparing the above result with those achieved by other methods, of which we have the canal clearance method (Barlow, 1937), carried out in Moustorod, an area of about 875 acres, half of which, that is only 1.5 per cent of the area of Kom-Ombo, was treated six times at 2 monthly intervals, the following may be noted:

(a) In the clearance year (Graph IV); after the first two of the six canal clearances were concluded, in April and May respectively, the maximum rise in the snail population was reached in June; it amounted to 62.5 per cent of the maximum in the cleared condition as calculated from Barlow's table No. 2, page 341.

(b) In the post clearance year (Graph V); the maximum rise here was reached in July and amounted to 44.44 per cent of the snails in the non-reached condition calculated as mentioned above. This figure was reached 16 months after the first clearance and only 4 months after the last, or sixth, clearance.

GRAPH IV.

The canal clearance method, Moustorod, Egypt. Clearance year. Clearance months are underlined. Graph-line in solid black shows percentage of the snails in the cleared canals. Graph-line in spaced black shows state of the same canals if untreated, using Barlow's control. (Vide Barlow, 1937, table 2, p. 341).

GRAPH V.

The canal clearance method, Moustorod, Egypt. First post-clearance year. Graph-lines as in Graph IV.

In table from the result reads as follows :—

TABLE No. 107.—COMPARATIVE RESULTS OF CANAL CLEARANCE AND COPPER SULPHATE METHODS

	Canal clearance method	Chemical method	Observations
	<i>Treatment year</i>		
June	62·5%	2·4%	3 months after the canal clearance and one month after the chemical treatment.
	<i>First Post—treatment year</i>		
June	27·7%	9·3%	More than one year after the application of either methods.
July	44%	6·3%	
	<i>Second Post—treatment year</i>		
July	Not observed.	6·5%	More than 2 years after the chemical method.

The following conclusions are accordingly drawn :—

(1) The chemical method, using copper sulphate, is applied only once to each canal, while the canal clearance method is applied 6 times to each canal, at 2-monthly intervals.

(2) In the canal clearance method the minimum number of workdays necessary for an area of 200 acres is 543 days, while in the chemical method this figure is reduced to only one day for each 200 acres.

(3) In the canal clearance method the amount of human labour required is accordingly 543 times as much as in the chemical method.

(4) Canal clearance work is therefore long and tedious, but the chemical method is “ Blitz-like.”

(5) When vast areas of cultivated land, as in Egypt, with a figure of 6 million acres are concerned, the application of the canal clearance method is practically impossible, both regarding the time available and the number of workers required ; these two factors are negligible in the chemical method.

(6) The huge masses of workmen employed in the canal clearance method are exposed to infection with Bilharzia, while, the water treated with copper sulphate is practically safe for the already small number of workers required.

(7) The result of canal clearance work is delayed and apparently less durable, while that of the copper sulphate is immediate and longer lasting.

(8) The cost of the canal clearance method is at least 14 times as high as that of the chemical method, not taking into account the wear and tear of any utensils used in the canal clearance.

* * *

After concluding the treatment of an area by whatever method which may be found suitable, the following question arises :—

When should the same area be treated ? In other words, when should this area become dangerous again to require another treatment?

This question is answered only in part by Barlow, who, when finding the snails rising so quickly to the above-mentioned figure of 44·44 per cent only 4 months after the last clearance, suggested a monthly or bi-monthly clearance extending over a period of several consecutive years. This would increase tremendously the cost of snail control by the canal clearance method, as it has already been mentioned that a bi-monthly clearance for a period of one year only costs 14 times as much as the copper sulphate method.

After the conclusion of the treatment in Kom-Ombo with copper sulphate, our next aim was to keep on examining the canals, monthly when possible, or bi-monthly, for the purpose of finding out how long the improvement continues and when, as mentioned above, will it be necessary to repeat the treatment.

Considering the above mentioned result as a whole, it can be safely concluded that, after more than two years, the condition of the canals remained so good that there could yet be no question of repeating the treatment.

On the other hand, discussing the result from another aspect, that is, considering each canal alone, it can be seen from table No. 108, that a rise in 9 out of 33 stations (st. No. 2, 51, 57, 80, 86, 110 b, 113 b, 117, and 201) to about 100 per cent occurred after two years; of these, st. No. 2 and No. 86 show a high figure almost throughout the heavily infested periods of the two years, while in st. No. 51 and No. 201 the rise was registered only during the second year. Out of the remaining four stations, No. 110 b, 113 b and 117 show only a rise in April 1942, and in st. No. 80 the rise was registered both in March 1941 and April 1942 only. Furthermore, a rise of only 25–30 per cent is noted in st. No. 9, while in the remaining 22 stations only 5 per cent have been registered after two years. This means that:—

(a) The improvement after a single treatment with copper sulphate was maintained during the following two years in 66 per cent of the canals and it is evident, therefore, that another treatment is not yet indicated.

(b) In only 30 per cent of the canals, the condition returned more or less to its previous state of heavy infestation with snails after the lapse of one to two years. Obviously these canals should be treated again as soon as possible. Yet another factor must be taken here into consideration; this is the percentage of infected snails in these canals, or, to be more precise, the percentage of snails evacuating free cercariae. The figures obtained were as follows:—

TABLE NO. 108.—NUMBER OF *BULINUS* FOUND AT DIFFERENT STATIONS DURING A ROUTINE EXAMINATION LASTING OVER TWO YEARS AND FOLLOWING THE APPLICATION OF THE COPPER SULPHATE.

Neg. = no snails whatever found on this occasion.

— = no Bulinus snails found on this occasion.

N.B.—Where no figures are given, this means that the examination of the station in question on that occasion has not been concluded due to circumstances beyond the control of the authors.

(1) An examination made in May, 1942, revealed 1 positive in 350 snails, or 3 per thousand.

(2) Another examination made in July, 1942, revealed 2 positive in 250 snails, or 8 per thousand.

In an area heavily infected with Bilharzia, this figure is apt to rise up to 15 per cent in July. The canals would therefore be only dangerous should the number of actively infected snails be high. This being only 0.8 per cent as against 15 per cent, renders the canals in question safe or at least not quite dangerous until the next rise in the number of snails, that is in June of the following year. This is because the snails require some time to become infected, if they are ever going to be; in addition, some other period must elapse for those, once infected snails, to be dangerous, that is to evacuate active cercariae. Simultaneously the number of the snails continues to decrease due to natural elements. These are the indirect effects of the Nile flood, beginning late in July and lasting for about three months, followed by the cold winter months and finally the winter closure of the canals (the last factor, however, does not count appreciably in Kom Ombo). From the above considerations, it can be safely concluded that, even in the deteriorating 30 per cent of the canals a second treatment is not indicated until the next rise in the number of snails, that is in June, 1943, when the number of infected snails would naturally be higher. In

other words, the next treatment of the canals, and only of 30 per cent of them would be indicated three years after the first treatment, while the rest of the canals in which the improvement is maintained should remain under observation for the purpose of determining the date of their next treatment from the same view points discussed above.

The second question which arises is the following:—

Why, in an area which has been treated with the same method and under the same conditions, two opposing results are obtained after the lapse of two years? In other words, why an improvement is maintained in two-thirds of the canals, while a return to the pre-treatment condition is observed in the remaining third? It is true that the canals, being in the same locality and forming subsidiaries of a single large canal, should show the same, good or bad, result, perhaps with some minor differences due, among other reasons, to their capacities and to the point where they arise from the main canal Cassel. We are rather inclined to attribute this diversity in result to a failure in the treatment of the canals in question. Reference has already been made in detail to the possible causes of failure and to measures counteracting them. These are:—

(1) The copper sulphate was used in a too low dilution of 5 per million. It has been recommended that a 6 to 7 per million dilution should be made with an addition of 1 per million for a possible uneven distribution.

(2) Inspection of the canals during the treatment period revealed the fact that some of them were opened for irrigation before the lapse of the 5-days treatment period. These indiscriminations, which certainly had a deteriorating effect on the result, should be countermeasured by chaining and locking the intake gates during the treatment period.

(3) Some canals were apparently empty at the start of the treatment while they actually contained large amounts of water in their distant, lower portions. Such water collects at the end of the canal, which is usually more infested with snails, and thus remains inaccessible to the drug. Unless this is guarded against, a complete failure is certain. It was suggested that, in order to avoid misinformation as to the state of the canal immediately prior to treatment, one should not rely on outside information. One of the staff should therefore be provided with a suitable means of communication to inspect the whole canal before the copper sulphate treatment is applied.

In conclusion, the following suggestions are made:—

(1) For the purpose of continuing the work of snail destruction in Kom-Ombo, already begun in April 1940, a re-examination of all the canals about the end of the third year, that is, in April, 1943, should be made.

(2) It is presumed that one third of the canals will be found to require a second treatment with copper sulphate.

(3) A yearly examination of the canals, in April, will be followed by an immediate treatment (in May) of canals found to require such.

The above suggestions means that a locality like Teftiche Wadi Kom-Ombo will have, at most, to be treated once every three years, either as a whole lot or at the rate of one third of the canals each year.

However, the future advance in the technique and the inevitable experience which will be gained by those carrying out the treatment and lastly the sincere cooperation of those for whom the treatment is being done will render, it is expected, the period between every two treatments of a canal with copper sulphate appreciably longer than three years.

B.—The Palm-leave as a Snail Trap; a Preliminary Report

The need for a uniform method of examination of snails to determine the degree of infestation with snails is urgent during Bilharzia campaigns. Apart from the variation in the rate of infection with Bilharzia cercaria of the snail intermediate host which may be taken as a measure of the effect of treatment and propaganda the number of snail population in a given canal is the sole indication of the effect of the measures taken against the snails themselves. Snail counts have therefore to be made both before and after the introduction of the measures themselves. They have to be made both in the treated canals and in those taken as a control. A whole count especially when large areas are

concerned is not possible and the count of certain constant areas of the canal was found tedious and even impracticable ; objections to this method as carried out by Barlow (1937) were raised already by Khalil Bey and Hilmy (1940).

The object of this short communication is to give a short description of a simple snail trap, by means of which the presence of snails and the degree of infestation in a given canal is determined in an easy and valuable manner.

The trap used is a branch of a palm tree which is freshly cut on the spot. This is available everywhere in the country. The leaves should be fresh, green and intact. It is advisable to use a constant length, say of one metre, by discarding the surplus from both ends, as very long or very short leaves are not suitable for the purpose ; they proved of no value in giving protection to the snails in the water. A piece of stone is fastened by a string to the branch at a suitable point of its length, to help the trap to submerge in the water, in a horizontal position. The top of the branch should be directed downstream, and the upper surface of the leaves opposite the canal bed. The other end of the string holding branch and stone should be fastened somewhere on the edge of the canal, preferably to a simple sort of peg, submerged under the water, to escape the attention of passers-by. After the lapse of a few days, the trap should be raised carefully and counting and sorting of any snails found should be made immediately. The collection of the snails from the trap is made easily by placing the trap, top downwards in the middle of a white painted dish of water and scraping gently every single leave between two fingers, rinsing the finger in water from time to time. This is to release any snails and silt on the hand into the water in the dish, to prevent silt from drying on the hand and the water from evaporating to dryness and thus to avoid infection with *Schistosoma cercariae*. So far it has been found that rubber finger gloves are not necessary at all. Under the white dish, a rubber sheet of about one metre square should be placed, as some of the snails fall down outside the dish during the process. When all the leaves have been wiped clean, the dish is removed, the contents of the rubber sheet should be flushed into the dish, the contents of the dish poured into a suitable wire-net, the residue washed in the canal, then thrown on the cleaned rubber sheet or white dish, counted, sorted and the obtained figures registered and then the snails thrown back into the water.

This simple trap has been used repeatedly during the last 15 years and it proved itself of value in finding snails in large canals where the wire-net has so often failed. Along the course of the Nile and even in the Aswan Dam, snails were discovered by this trap. Only recently it has been attempted to use it as a means of determining the intensity of the snail population of the canals before the campaign in Kom-Ombo was started. Following is a table showing the number of snails caught by different traps which have been left in the water for varying periods. It shows clearly the rising number of snails as the period of stay in the water increases. Further experiments will show to what extent this should continue.

TABLE NO. 109.—SHOWING THE NUMBER OF SNAILS CAUGHT BY DIFFERENT TRAPS WHICH HAVE BEEN LEFT IN THE WATER FOR VARYING PERIODS

Station No.	Measurements of the trap	Number of days	Snails found					Total number
			Bulinus	Physa	Vivipara	Planorbis	Melania	
6	150 × 60 × 50	1 day ...	—	—	1	—	—	1
	150 × 60 × 50	4 „ ...	—	—	27	—	—	27
	150 × 35 × 60	5 „ ...	1	2	25	—	—	28
1	165 × 60 × 30	1 „ ...	—	—	1	1	—	2
	155 × 65 × 50	5 „ ...	—	—	18	—	—	18
	160 × 60 × 40	7 „ ...	—	12	25	—	—	37
5	165 × 60 × 30	4 „ ...	10	—	2	—	—	12
	195 × 55 × 25	7 „ ...	38	77	7	—	—	122
3	45 × 30 × 15	1 „ ...	5	2	4	22	—	33
	15 × 30 × 15	4 „ ...	15	241	5	52	1	314

The next table shows the result of a series of experiments in which the traps were used in pairs at each experimental station, one trap on either side of the canal. They were then left in the water for an equal number of days and the snails on them were counted. The total number of snails on either trap of each group was registered together with the number of each kind. It is significant to note that the total number of snails on the traps of each group is almost equal for equally large traps. Only in experiment No. 3, when one trap was more than $1\frac{1}{2}$ times larger than the other, the figures obtained were accordingly different. Further experiments will aim at explaining the difference in the number of each group of snails. One thing seems certain, however, it is that this variation does not affect very much the predominant snail present in the canals, should there be one. In Kom-Ombc, the predominant snail in each canal was either *Bulinus* or *Physa*, the other species were only found in very small, almost negligible number. This condition was welcome, as it rendered the use of the trap possible and correct, granting a margin of about 15 per cent for the possible error. Should, on the other hand, they contain only one type of snails, as for example, *Bulinus*, the results obtained by this trap should be as exact as could be practically hoped for.

TABLE NO. 110.— SHOWING THE RESULT OF THE TRAPS USED IN TWO'S AT EACH EXPERIMENTAL STATION, ONE ON EITHER SIDE OF THE CANAL

[illegible]

Bacillus Freidlander	3
Bacillus Para colon	4
Bacillus Paratyphosus B in	1

Auto vaccine treatment was carried out in 6 cases (2 B. coli, 2 Pyocyaneus, 1 Freidlander and 1 of B. para B.).

IV.—*Sputum for T.B.*

Total number of specimens examined	42
Positive cases	5

V.—*Urethreal Discharge for Gonococci.*—One positive case.

VI.—*Swab for Diphtheria.*—One case examined with a negative result.

An outbreak of dysentery occurred among the prisoners in Abu Zaabal. The specimens examined in the Institute numbered 73, with the following results:—

Ent. histolytica	8 cases
Giardia lamblia	1 case
Sch. mansoni	1 „
Bacillus Flexner	7 cases
Bacillus Shiga	4 „
Bacillus Morgan No. 1	5 „
Bacillus Para A	1 case
Bacillus Para B.	8 cases

The rest of the specimens gave negative results.

3.—Clinical Report

A.—*Outpatient.*

During the first 10 months of this year the outpatient work was done in the Ankylostoma Hospital No. 12. Our doctors were doing the examination there. Only problematic cases were referred to the Institute for further investigations and treatment. During November and December the Institute used to receive 30 patients a day as outpatients. These patients were examined clinically in detail by medical officers of the Institute. Investigations necessary for them were done and their treatment were carried out also in the Institute.

Considering the above circumstances we had received 2,190 patients during the whole year. The urine, stools, blood, etc., of these were done as well as the clinical examination which revealed the following:—

I.—*Schistosomiasis Infection.*

Out of the above 2,190 patients that attended the hospital, 687 cases were found infected with Schistosomiasis infection (*i.e.* about 30 per cent of the cases).

As regards the treatment adopted, tartar emetic was used in the usual doses for 12 injections after which an examination of the urine and stools was done and if still positive 2 more injections were given and examination repeated and so on every two injections till the examination proved to be negative. Then the patient was asked to return for re-examination after one month and if found positive the treatment was repeated again and if found negative he was asked to call every month to have an idea of recurrences and latent complications if any. It is rather interesting to note that during the whole year no serious complications have arisen during the tartar emetic course. Cough occurred in some cases but was not serious and continued for about 10 minutes or so. In some cases, collapse occurred 5 minutes to 1 hour after injection but the patient was soon brought to by some stimulating injections, *e.g.* Caffiene, Strychnine ampoules as well as 20 cc. of mixt. of Ammonia and Ether.

II.—*Helminthic Infection.*

The total number of patients who attended the outpatient clinic was 2,190. Examination of the stools by smear and floatation method gave the following results:—

[illegible]

The method of treatment adopted was the same as that adopted in preceding years. No deaths from treatment were recorded throughout the year.

III.—*Hepatosplenomegaly.*

This category was divided into 3 groups :--

- (a) Enlarged liver, only.
- (b) Enlarged spleen only.
- (c) Enlarged spleen and liver.

All the cases belonging to these 3 groups had been investigated thoroughly in order to determine the cause for enlargement. The stools and urine were examined for parasites. W.R. and Kahn was done to all cases as well as a Widal test, to exclude typhoid. A thick drop was taken from every case to exclude malaria. If no cause was found a blood picture was made. Sigmoidoscopic examination was not done this year as the lamp was missing and we could not get one instead. Our investigations revealed the following:—

Group (a).— *Enlarged livers.*

Total number of 522 cases were investigated with the following results :

Intestinal S.h. in	6
Intestinal S.m. in	20
Urinary S.h.	115
Urinary S.m.	—
W.R. or Kahn+	10
Widal+	3
Combined urinary and intestinal schist.	25
B.T. malaria	—
M.T. malaria	—
Blood diseases	—
Heart failure	8
Entamaeba histolytica	30
Unknown cause	305

Group (b).—*Enlarged spleen only.*

Total number of 62 were investigated with the following results:

[illegible]

Group (c).—*Hepatosplenomegaly.*

A total number of 692 cases were investigated with the following results :

Intestinal S m.	54
Intestinal S.h.	21
Urinary S.h.	212
Urinary S.m.	—
Combined urinary and intestinal Bilh.	119
W.R. or Kahn +	13
Widal +	20
B.T. malaria	12
M.T. malaria	8
Hodgkins	2
Heart disease	1
Entamaeba histolytica	13
Unknown cause	217

IV.—*Anaemias.*

Patients presenting apparent anaemia were examined to find out the cause of their anaemia as well as to determine the degree of anaemia present. Patients presenting a Hb. below 60 per cent Sahli were considered as suffering of anaemia. The stools of these patients were examined for parasites and their blood examined for syphilis, malaria, etc., and a blood count is done in negative cases as well as the I.I to determine if there is a haemolytic factor in the condition. Investigation on 413 patients with Hb. below 60 per cent revealed the following :—

Parasites were demonstrated in 358 cases. Ankylostoma was present in 274 cases. 30 cases were suffering of Intestinal Bilharzia, 14 of Urinary Bilh. and 20 with mixed Intestinal and Urinary Bilh. Ascaris was demonstrated in 16 and Trichostrongyloids in 4.

In 55 cases no parasites had been found. Syphilitic infection was found in 3 cases. Malaria was demonstrated in 12 cases, 5 of which were benign and 7 malignant. A case was found due to bleeding piles and thus haemorrhagic in nature while diabetes accounted for 1 and T.B. of chest for 3 cases.

A case of leuco-erythroblastic anaemia was met with in a child of 11 years. His Hb. was 30 per cent and had Ankylostoma infection as well. X-Ray of the skull and long bones revealed no abnormality, no signs of haemolysis could be found. The patient had a big liver as well as a big spleen. A tuberculin test was found negative and glucose curve was normal. The case was diagnosed as a leuco-erythroblastic anaemia of unknown cause.

In Ankylostoma anaemia, the degree of anaemia ranged from 10–60 per cent Hb. Sahli. The majority were between 10–50. Patients presenting 10–20 per cent Hb. were 51, 20–30 were 71 ; 30–40 were 56 ; 40–50 were 55 and 50–60 were 41 cases.

As regards age distribution, anaemia was most marked in patients between 10 and 30 years as shown in table below.

TABLE No. 111

Age	below 10	10–20	20–30	30–40	40–50	50–60
Hb.	16	105	72	56	19	4

Iron was used in the treatment of these cases. 1 gm. of Ferric and Ammon. Citrate T.D.S. till the Hb. rises above 55 per cent and then the patient was given his purge as usual or his tartar emetic course.

V.—Dysenteries.

Patients presenting themselves complaining of dysenteric manifestations were examined clinically to find out tumours or bilharzial abdominal masses. The liver was looked for to find out any enlargement or tenderness. The spleen was examined and if found enlarged a thick drop was taken to eliminate the possibility of malaria being the cause of this dysentery. Then the stools were examined by direct smear and floatation to detect any parasites, *e.g.* Schistosomiasis infection. A sedimentation was made to find out Heterophyes heterophyes infection. Then the stools were sent for amoeba and flagellates examination. If still negative a culture was done for any bacillary infection responsible for this dysentery. At last a sygmoidoscopic examination of the bowel was done to find out ulcers, papillomata or otherwise. If still negative a fractional test meal was done to eliminate a gastric factor.

As regards the treatment of dysentery followed this year, it logically varies with its cause. In Schistosomiasis infection the usual antibilharzial remedy tartar emetic was used in the usual way. In amoebic infection whether of the vegetative or the cystic form, emetine 0.06 was given with strychnine daily for 6 days after which the stools were examined and if still positive a further 4 injections were given.

In Heterophyes heterophyes infection extract of felix mass was given at 4 cc. for an adult in $\frac{1}{4}$ hourly doses of 1 cc. capsules, and 1 hour after the last capsule a saline purge was given. The patient should be previously prepared by a saline purge the night before.

In Giardia lamblia vegetative or cystic, atebirin was used in the following way. First the patient was given a purge the evening before the taking of the drug. The following morning he was given one tablet of Atebrin Bayer 0.1 gm. every $\frac{1}{4}$ h. and then $\frac{1}{2}$ hour after the last a saline purge was given. The number of cases treated that way were so small to give any idea about the efficiency of the drug used as such. (The ordinary method was to use a full course of 5 days, 3 tablets daily).

During this year 355 cases attended at the Institute complaining of dysentery. Investigation revealed:—

(1) 59 cases were found positive for vegetative amoeba. In 23 cases the liver was found enlarged and tender. 42 cases were given 6 emetine injections and of these 28 turned negative, 3 remained positive and 11 became encysted.

(2) *Entamoeba histolytica* cysts were found to be the cause in 18 cases. The liver was enlarged in 6 cases only. 6 cases received the full course of emetine (6 injections), five became negative and one remained positive.

(3) 54 cases were found to be caused by Schistosoma infection of the intestinal tract whether the infection was haematobium or mansoni or both together.

(4) Flexner infection was demonstrated in only 1 case of the series.

(5) 8 cases were due to *Heterophyes heterophyes* infection. 4 were treated and proved negative after the 1st dose.

(6) *Giardia lamblia* was responsible for 15 cases of dysentery in this group. 3 of these received the treatment just mentioned and proved negative.

(7) 2 cases were found infected with Hymenolepis.

(8) Fractional test meal was done in 25 cases with the following results:—

Normal test meal in	3
Hypo acidity	7
Hyper acidity	10
Achylia	5

VI.—Pellagra.

During this year 87 cases of pellagra attended the Institute. Their monthly incidence showed the marked prevalence of the disease during March, April and May as shown in the following table.

TABLE No. 112

	Jan.	Feb.	March	April	May	June	July	August	Sept.	Oct.	Nov.	Dec.
No. of cases	6	7	20	14	18	8	5	1	2	2	—	4

In these series only 9 cases occurred in the female sex, *i.e.* about 10·4 per cent.

Incidence of Associated Parasites.

A look at table No. 113 shows that the disease is most commonly associated with Ankylostoma infection either alone or in association with other parasites. Next in order came combined infection of the urinary and intestinal tract with Schistosomiasis.

TABLE No. 113

Parasite	No. of cases
Ankylostoma pure	11
Ankylostoma and Ascaris ...	12
Ankylostoma and Schistosomiasis	19
Ascaris pure	8
Intestinal Bilharzia	6
Intestinal and Urinary Bilh. ...	15
Urinary Bilharzia alone	2
Entamoeba hystolitica	2
Negative for parasites	12

Symptoms of Pellagra.

Diarrhoea varying from 3–20 times defecation in the 24 hours was noticed in 68 cases of the series, *i.e.* about 80 per cent of the cases.

The rash was generalised on face, neck, hands and feet in 37 cases. In 17 cases it occurred on hands and feet, 12 cases on neck and hands while in 9 cases it was confined to the hands and in 12 to the neck only.

Riboflavine deficiency was noticed with a rash on the lips in 3 cases.

Glossitis occurred in 2 cases while the nervous system showed increased reflexes in 6 cases. In no case was a definite subacute combined picture noticed.

Test Meals in Pellagra.

42 cases of histamine meal was done in the series with the following results:—

Hyperacidity	20 cases
Hypoacidity	10 „
Achylia	12 „

It appears that the condition of the gastric mucosa passes through the same stages as occurs in the tongue. In the very early cases there is acute inflammation leading to increased activity of the secreting glands of the stomach and thus giving rise to increased acidity. This stage is the analogy of the acute glossitis of the early cases. Attack after attack or as the disease becomes chronic by time, the mucus membranes atrophy leading to gradual decrease of function passing through the stages of hypoacidity and achylia. This 2nd stage is the analogy of the atrophic smooth condition of the tongue. The same phenomenon occurs not only in the mucous membranes but also in the skin which begins with the inflamed erythematous condition to end in the atrophic thin skins of healed pellagrous rash.

Chapter XXI.—MEMORIAL OPHTHALMIC LABORATORY, GIZA

Throughout the year 1942, the Memorial Ophthalmic Laboratory has continued to fulfil the functions for which it was originally created, namely to assist in the training of ophthalmic surgeons, to serve as a pathological laboratory for the many ophthalmic hospitals scattered throughout the Country and to act as a centre for clinical and bacteriological research in ophthalmic diseases especially those peculiar to Egypt. It is therefore convenient to review the work of the year under these headings:—

(1) *Post-graduate Training.*—The staff of the Laboratory again took part in the post-graduate instruction of candidates for the Diploma in Ophthalmic Medicine and Surgery. This included clinical, surgical, pathological and bacteriological teaching which was supplemented by practical instruction.

(2) *Pathological Department.*—The routine pathological work of the Laboratory continues to increase steadily with the increasing number of patients treated in hospitals throughout Egypt. It is interesting to note, however, that fewer blind eyes have been submitted for examination, which is indicative of the steady reduction in the incidence of blindness. Many specimens of interest were encountered during the year and these will be referred to more fully in the Annual Report of the Laboratory.

(3) *Clinical Investigation.*—As in medicine generally, so in ophthalmology cases continually arise which present puzzling characters and which therefore require more careful study and examination by specialized technique. Many such cases have been dealt with during the year and those which were of most striking interest will be referred to in the detailed Annual Report of the Laboratory.

(4) *Research.*—Subjects of clinical, therapeutic and bacteriological interest have received careful attention. Experiments on the treatment of acute ophthalmias by means of sulphonamide derivatives have been continued and the amazing efficacy of their results is established beyond any doubt. This drug may well be regarded as of epoch making importance to the welfare of humanity. Whereas in the past thousands of children were blinded annually as a result of ophthalmia, now no eye should ever be lost through this cause.

Unfortunately, research into the aetiology of trachoma has not produced such striking results, but progress, nevertheless, continues to be made, and from the therapeutic point of view sufferers from this disease may also receive some benefit from the drug already referred to.

This short report summarises very briefly some of the activities of the Laboratory, but those wishing to have further details should consult the Reports published annually by the Memorial Laboratory.

Appendix I.—MEDICAL PERMITS

TABLE No. 114.—SHOWING THE NUMBER OF PRACTITIONERS OF THE MEDICAL AND ALLIED PROFESSIONS AT THE END OF THE YEAR 1942 AS COMPARED WITH THAT OF THE YEAR 1941

PROFESSION	At the end of 1941	At the end of 1942
Medical Practitioners	3,718	3,913

Appendix II.—MEDICAL COMMISSIONS

The Central Medical Commission.

During the year 1942, the Central Medical Commission issued 23,135 medical certificates with an increase of 3,094 medical certificates as compared with the figure of 1941.

Of this number, 9,125 were for sick leaves. Of these, 5,845 concerned pensionable and temporary officials and 3,280 hors cadre employees.

Of those granted sick leave by the Central Medical Commission, or by Cairo District Medical Officers and approved by the Central Medical Commission, 2,396 pensionable and temporary officials and 746 hors cadre employees were found suffering from medical diseases and 1,097 of the former and 609 of the latter were found suffering from surgical and ophthalmic diseases.

The percentage of the most prevalent diseases were as follows:—

TABLE NO. 120

Diseases	Pensionable and Temporary Officials		Hors Cadre Employees	
	Number	Ratio to total 3,493	Number	Ratio to total 1,355
		%		%
Bronchi and Lungs	309	9	130	9
Heart and Blood Circulatory System	201	6	28	2
Stomach and Intestines	93	3	46	3
Liver	102	3	15	1
Kidney and Cystis	159	5	52	4
Neurasthenia and mental diseases	120	3	32	2
Nervous System	95	3	16	1
Anaemia and General Debility	297	8	86	6
Rheumatism	326	9	89	6
Fevers	199	6	85	6
Nose and Larynx	174	5	62	4
Other Medical Diseases	321	9	105	8
Eye diseases	151	4	61	4
Ear and Dental Diseases	103	3	29	2
Urinary System and Stones	47	1	18	1
Various Surgical Operations	498	14	278	25
Fractures	128	4	155	11
Minor Surgical Operations (fistulæ, piles, hernia and hydroceles)	170	5	68	5

The number of sick officials and employees who were granted from 1–10 days' sick leave by Cairo District Medical Officers or by Markaz and Sanitary Outpost Medical Officers in all the provinces and governorates during the year 1942, was 43,302, of which 35,108, or 81 per cent suffered from medical diseases, 3,726, or 9 per cent suffered from surgical diseases, and 4,468, or 10 per cent suffered from ophthalmic diseases.

The number of patients who were granted from 1 to 10 days sick leave by the Central Medical Commission or by Cairo District Medical Officers and approved by the Central Medical Commission was 1,018 pensionable and temporary officials and 597 hors cadre employees.

The number of patients who were examined by the Central Medical Commission and were not granted any sick leave was 158 pensionable and temporary officials and 108 hors cadre employees.

Those examined by the Provincial and Governorate Medical Commissions and were not granted any sick leave were 505 pensionable and 600 hors cadre employees.

The number of patients who were granted from 11 days to 30 days sick leave and upwards by the Central Medical Commission and by Cairo District Medical Officers was 2,475 pensionable and temporary officials and 758 hors cadre employees.

The Central Medical Commission granted 22 pensionable and temporary officials longer sick leaves terminating by their retirement on pension and pronounced 274 hors cadre employees medically unfit for further service.

20 pensionable and temporary officials and 96 hors cadre employees were examined by the C.M.C. and pronounced fit for further service.

Of a total of 9,996 candidates for Government service and Educational Missions abroad examined by the C.M.C. 5,646 were pensionable and temporary officials and only one candidate for Missions abroad and the remaining 4,349 were hors cadre employees.

Of the candidates for pensionable and temporary Government service, 23 per cent were rejected and 77 per cent accepted. Of the hors cadre candidates, 41.5 per cent were rejected and 58.5 per cent accepted.

Of the candidates for pensionable and temporary Government service, 19 per cent were rejected for defective vision, Myopia being the main cause; 2 per cent for defects in the urinary system with albumen or its traces as the main cause; 1 per cent for heart diseases, incompetency being responsible for most cases; and 1 per cent for other diseases, *e.g.* varicoceles, hydroceles, apparent poor constitutions or diseases of the respiratory system, etc.

Medical Examination of Private and Passenger Pilots.

The number of candidates for private pilot licence "A" who presented themselves for examination before the Central Medical Commission during the year 1942 was 99, of which 61 passed successfully (49 in the first session, 11 in the second, and 1 in the third session). The failures were 38 (34 having failed in the first session, 3 in the second session, and 1 in the third session).

10 candidates for passenger pilot licence "B" were examined by the Central Medical Commission during the year 1942, of whom 9 passed successfully (8 in the first session, and 1 in the second session). One only failed and he was examined once.

During the year 1942, 69 private pilots were examined by the Central Medical Commission for renewal of their licences of whom 55 were found fit (54 having succeeded in the first session and 1 in the second session). The failures were 14 (12 having failed in the first session and 2 in the second session).

Sixty-six were examined for the renewal of passenger pilot licences, of whom 63 were found fit (60 having succeeded in the first session and 3 in the second session) and 3 were finally rejected after having been examined once.

Provincial and Governorate Medical Commissions.

31,658 medical certificates were issued by the Provincial and Governorate Medical Commissions during the year 1942, *i.e.* an increase of 1,125 certificates over those of last year.

TABLE No. 121.—ANNUAL RETURN OF MEDICAL EXAMINATIONS BY THE CENTRAL MEDICAL COMMISSION AND PROVINCIAL MEDICAL COMMISSIONS DURING THE YEAR 1942

Appendix III.—CENTRAL STORES

As in previous years and despite difficulties arising from the war, the Central Stores managed to keep all the units of the Ministry supplied with modern apparatus, surgical instruments and drugs, all the time adopting a policy of economy consistent with prevailing conditions and by no means hindering the progress of the work. Arrangements were also made for provisioning hospitals and other treatment centres.

Specifications of articles put in general adjudications are modified from time to time by technical experts and modern samples selected to meet present day requirements.

Besides, the following new units were provided with the necessary equipment and appliances :—

- (1) Completing the equipment of Boulac Health Group.
- (2) Equipment of two Ankylostoma Branches within Ayat and Shubrakhit District Hospitals.
- (3) Providing the Chest Diseases Hospital, Abbassia, with the necessary equipment and instruments required for its enlargement.
- (4) Equipment of an Ear, Nose and Throat Section in a District Hospital.
- (5) Equipment of Princess Khadiga Abbas Halim Hospital for Bone Tuberculosis.
- (6) Equipment of a T.B. Isolation Home.
- (7) „ „ Malaria Station.
- (8) „ „ Dental Clinic.
- (9) „ „ Skin and Venereal Diseases Clinic in Assiut.
- (10) „ „ the Reception and Isolation quarters at the Abbassia Fever Hospital.
- (11) Equipment necessary for the conversion of three Ankylostoma School Clinics from the old to the new system.
- (12) Equipment necessary for the introduction of Village Ophthalmic Treatment in six Health centres.
- (13) Equipment necessary for the enlargement of Demerdash Pasha Hospital.
- (14) Completing the equipment of two travelling Child Welfare Centres.

SUMMARY OF THE REPORT OF THE ALEXANDRIA MUNICIPALITY HEALTH DIVISION

DETAILS OF POPULATION, BIRTHS, DEATHS, INFANTILE MORTALITY AND INFECTIOUS DISEASES CASES AND DEATHS

1.—*Population* :— 735,600

2.—*Births* :—

(a) <i>Alive</i> :	<i>Egyptians</i>	<i>Foreigners</i>
Males	12,493	443
Females	11,847	455
	<hr/>	<hr/>
	25,238	
	=====	

or a birth-rate of 34·2 per thousand population.

(b) *Still Births* : 1·2 per thousand population.

3.—*Deaths* :—

Males	9,491	985
Females	7,618	483
	<hr/>	<hr/>
	18,577	
	=====	

or a death-rate of 24·1 per thousand population.

4.—*Infantile Mortality* : 5,151 or 204 per thousand births.

5.—*Children Deaths* : (1-5 years of age) : 4,342 or 233 per thousand.

6.—*Cases and Deaths of Infectious Diseases* :—

Cases 14,885
Deaths 2,409
Case-rate per thousand of population 20·2
Case-fatality-rate 16·2 per cent.

CAIRO CITY HEALTH INSPECTORATE

A.— VITAL STATISTICS

Population.

The estimated mid-year population of Cairo in 1942 was 1,419,800.

Births.

The total number of births (excluding still-births) recorded during the year was 65,455 or 46·1 per thousand of the population with an increase of 2,356 over the previous year.

Table No. 127 gives the distribution of these births over the various Cairo Kisms and their ratio per thousand of the population.

The number of still-births recorded during the year was 1,530 or 23·4 per thousand births as compared with 1,310 still-births during last year.

Deaths.

A total of 53,787 deaths were recorded during the year. This included 3,452 deaths among non-residents leaving 51,335 deaths for Cairo proper with an increase of 11,540 over last year and a ratio of 36·2 per thousand population, as compared with a ratio of 28·5 in 1941, 26·9 in 1940, 25·9 in 1939, 27·8 in 1938 and a mean death rate of 26·4 for the last five years (1936–1940).

Infantile Mortality.

A total of 16,208 deaths were recorded among infants under one year of age with an increase of 3,774 over last year and a ratio of 247·6 per thousand births as compared with 197 in 1941, 196 in 1940, 190 in 1939, 204 in 1938 and a mean death rate of 196·2 for the last five years (1936–1940).

Table No. 127 gives the deaths as recorded in the various Cairo Qisms.

Diseases Causing Infantile Mortality.

Diarrhoea and Enteritis are still responsible for the greater part of infantile deaths. Out of a total of 16,208 deaths, 9,577 or 59 per cent died of these diseases. General diseases come next with 3,322 deaths or 20·5 per cent. 2,096 or 12·9 per cent died of Marasmus and general debility, 623 or 4 per cent died of Chest diseases and 590 or 3·6 per cent of infectious diseases.

Death Inquiries.

The number of uncertified deaths which required investigation during the year was 30,455 or 59·3 per cent of the total deaths of Cairo.

Of these, 10,085 or 33·1 per cent were examined by the Medical officers of health; 19,433, or 63·8 per cent by Qism midwives and the remaining deaths occurred in villages surrounding Cairo and were examined by Sanitary barbers and Dayas.

Infectious Diseases.

During the year, 20,956 cases of infectious diseases were notified in Cairo City and 1,406 from outside as compared with 16,612 cases in 1941, 14,632 in 1940, 11,517 in 1939, 12,342 in 1938 and 14,138 in 1937.

The number of deaths from Infectious Diseases was 7,111 or 13·9 % of total deaths as compared with 11·5 per cent in 1941, 10·3 per cent in 1940, 7·5 per cent in 1939 and 8·4 in 1938.

Table No. 128 gives the number of deaths from the more prevalent Infectious diseases distributed according to Qisms.

For details *re* typhoid and typhus fevers, please refer to Chapter II.

Influenza.

2,002 cases of Influenza were notified with 41 deaths or a case rate of 1·4 and a death rate of 0·003 per thousand of the population as against 1,358 cases and 25 deaths with ratios of 0·97 and 0·02 in 1941 ; 1,851 cases and 30 deaths (1·3 and 0·02) in 1940, 1,937 cases and 36 deaths (0·698 and 0·011) in 1939 and 1,498 cases and 36 deaths (1·127 and 0·037) in 1938.

Tuberculosis.

A total of 3,181 cases of tuberculosis were notified during the year with 1,527 deaths or a case rate of 2·23 and a death rate of 1·07 per thousand of population.

Deaths attributed to Confinement.

126 deaths of mothers were attributed to confinement or a ratio of 1·92 per thousand births as against 2·5 in 1941, 2·2 in 1940, 2·6 in 1939 and 1938 and 2·5 in 1937. Of this number 36 or 0·55 per thousand births died of puerperal fever as against 0·9 in 1941, 0·8 in 1940, 0·7 in 1939 ; 0·9 in 1938, 1·6 in 1937 and 1·9 in 1936.

The number of mothers who died within a fortnight from giving birth (excluding puerperal fever deaths) was 90, as compared with 104 in 1941, 117 in 1940, 113 in 1939, 98 in 1938, 82 in 1937, and 124 in 1936.

The causes of these deaths were as follows :—

12 difficult labour, 8 postpartum hæmorrhage, 6 antepartum hæmorrhage, 32 eclampsia, 4 placenta preva, 1 caesarean operation, 1 rupture of uterus, 11 heart failure, 5 peritonitis, 5 infectious diseases, and 5 other diseases.

Disinfection.

A total of 107,753 rooms were disinfected during the year. Of this number 60,488 rooms were disinfected by Abbassia Disinfecting station and 47,265 by Fom el Khalig Disinfecting station.

Passengers

During 1942 there were 11,893 passengers who arrived in Cairo from infected countries, as compared with 10,562 in 1941.

Out of this total, 172 passengers arrived via Suez, 6,449 passengers arrived via Kantara; 1,326 passengers arrived by car via Ismailia and 3,946 arrived by air. Moreover, 7,082 passengers arriving from the Sudan through Shallal were observed for smallpox and meningitis.

All these passengers, with the exception of 70 who could not be traced, were observed during the regulation period, giving a percentage of 99·4 per cent observed.

Pilgrims

The number of pilgrims arriving in Cairo from the Hedjaz this year was 945 as compared with 520 in the previous year.

All the returning pilgrims underwent the regulation period of observation and were found in good health.

Of the 945 pilgrims who left for the Hedjaz, 15 pilgrims did not return, 14 remained in the Hedjaz, and 1 left direct for Wadi-Halfa.

In addition, 50 pilgrims from other districts than Cairo were observed and found in good health.

11 foreign pilgrims were also observed and found in good health.

Officials and employees of El Tor Mission numbering 57 were observed and found in good health.

Sanitary Control of Public Women

The total number of registered prostitutes for the year 1942 was 1,071. 288 of these were struck off the register during the year.

The total number of examinations held was 55,036.

127 prostitutes were found suffering from venereal diseases.

The number of arrested women was 2,624 as compared with 3,045 in 1941. The incidence of disease amongst them was as follows:—

Acute Gonorrhoea	16
Chronic Gonorrhoea	287
Primary Syphilis	7
Secondary Syphilis	203
Soft Chancre...	56
Scabies	2
TOTAL	<u>571</u>

Wasserman Examination of the Blood.

Prostitutes: 234 specimens were found positive.

Arrested women: 119 specimens were found positive.

POLICE HEALTH OFFICE

The strength of the Cairo City Police was 12,435 men in 1942. The following is a brief statement on the work carried out by this office during the year.

Medical Work.

Policemen examined for sick-leaves	875
Other police personnel examined for sick leaves	1,229
Medico-Legal Reports	30,280
Motor car and cab drivers examined for practising professions	4,002
Canditates examined for service in police force	171

Sanitary Work.

Inspection of police units	34
Number vaccinated against small-pox	636
Number vaccinated against typhoid (two injections)	1,848

The more common diseases among non-commissioned officers and policemen were : toothache, constipation, rheumatism, bronchitis and hydrocele. The number of cases of these diseases were : 520, 513, 485, 464 and 452 respectively.

The diseases more common among officers and civilians were : rheumatism, bronchitis, gastritis, and tonsilitis. The number of cases of these diseases were 250, 242, 149, 108, respectively.

46 police N.C.O's. and men were sent to the fever hospital suffering from typhoid and paratyphoid fever. 1,104 persons were put under observation for infectious diseases during the year.

Unhealthy, Inconvenient and Dangerous Establishments

The following establishments were licensed during the year. Under Law No. 13 of August 28,1904, and Arrêté of the Ministry of Interior of August 29 of the same year.

TABLE No. 146

1st. Class			2nd Class			3rd Class			Grand Total
Saha	Zabt	Total	Saha	Zabt	Total	Saha	Zabt	Total	
126	117	243	1,475	227	1,702	401	57	458	2,403

A total of 16,489 Unhealthy, Inconvenient and Dangerous establishments were inspected during 1942. Of these, 13,851 were found satisfactory and 2,638 unsatisfactory.

2,725 Procès-verbaux of contravention were drawn up against establishments exploited without licences and 1,442 contraventions were drawn up for lacking conditions in licensed establishments making a total of 4,167 contraventions.

Only one ministerial Arrêté was issued during the year in respect of an unhealthy establishment.

82 Cinemas, theatres, and other kinds of public establishments were inspected during the year under Law No. 1 of 1904 substituted by Law No. 38 of 1940.

General Sanitation

The activities of the sanitation section during the year 1942 can be summarised as follows.

1.—*Water.*

Samples of water were regularly taken from the different main water supplies of the City, Giza and Helwan in order to ensure the good quality of the water. Also samples of water were taken from taps in different parts of the city and from swimming baths. A total of 244 samples were taken from different sources during the year of which 30 samples were found unsatisfactory and the necessary steps were taken.

2.—*Free Water Taps.*

6 free water taps were erected, 4 in Cairo and 2 in Tura el Faroukia village, Helwan. A free water tap was proposed in Maassara village but was not erected owing to lack of piping.

3.—*Vegetable Washing Basins.*

Work was commenced during the year on two basins for washing vegetables intended for sale. One of these is sited in Mahmasha (Shoubra) and the other in Mataria.

4.—*Complaints.*

Some 906 complaints were received and dealt with during the year. 345 of these were^e in respect of mosquito breeding places, and 536 about sanitary systems of houses and fencing^g waste lands and cleanliness of streets and 25 were in respect of quack doctors.

5.—*Quack Doctors Squad.*

This squad continued to pursue quack doctors and ambulant vendors selling medicines and drugs without licences. Sentences of fine, confiscation and closure were given in 15 contraventions drawn up against offenders.

6.—*Mosques.*

4 water systems of private mosques were connected with the main sewers and 7 systems were repaired and opened for use.

7.—*Cemeteries.*

Approval was given to two sites for cemeteries for British troops, one in Abbassia and the other in Heliopolis.

8.—*Gulleys.*

Slap water gulleys were proposed in the poorer quarters to stop the inhabitants throwing their waste water into the streets. It was suggested that if such gulleys were combined with free water taps they would be kept in a clean condition. One such combination (gully and free water tap) was installed in Mohamady quarter with two single gulleys in close proximity.

9.—*Vidange.*

3,131 permits were given for evacuation of private cisterns, and 605 owners of houses were notified to evacuate the cisterns of their houses.

In the case of owners failing to evacuate the cisterns, the contractor is ordered to carry the work and the cost debited to the owners.

Boulac Health Group

In-Patient departments for chest diseases, venereal and skin diseases, and maternity and child welfare were opened this year within the Boulac Health Group. The remaining in-Patient departments as well as the out-patient clinic were not opened for lack of equipment.

The following is a statement of the work done by each department:—

Chest Diseases Department.

Out of 10,944 new patients who attended treatment during the year, 850 were T.B (553 positive-sputum for 297 negative). 313 deaths were recorded. Among 998 contact of positive cases, 13 developed pulmonary T.B.

The following is the distribution of the 850 tuberculous patients according to localities:—

759	Cairo.
10	Governorates.
22	Menoufia.
43	Kaliubia.
1	Gharbia.
1	Sharkia.
3	Dakahlia.
9	Giza.
1	Assiut.
1	Aswan.

The work done by this section was as follows:—

11,347 patients attended the Department.

67 Pneumothorax.

2,266 Sputum analysis.

1,143 X-Ray.

3,405 home visits by { nurses 3,042.
doctors 363.

9,219 treated in their homes.

Contributions to destitute patients during the year amounted to L.E. 434.312.

Venereal and Skin Diseases Department.

Total number attending treatment was 16,991 distributed as under:—

2,290	Gonorrhoea	2,075	cured and	215	discontinued treatment.
* 1,280	Syphilis	1,220	„ „	137	„ „
‡ 361	Other Ven. Dis.	223	„ „	63	„ „
